Beedy customer journey guide

From organization setup to the first submission and the next opportunity

Purpose

For Jacob and the product team. This guide explains how the approved MVP is meant to feel to a customer: build reusable organization knowledge, find a suitable grant, prepare a supported application, approve the exact package, submit it outside Beedy and bring the result back into the next cycle.

How to read this guide

This is an intended product journey, not a claim that every described feature is available today. The source documents report working foundations alongside incomplete and unverified behavior. They do not establish a fully accepted live release. Throughout, “Beedy should” describes approved target behavior; user steps describe the intended workflow rather than verified screen instructions.

The connected experience

The organization record supplies facts and voice. The program record supplies the proposed work and budget. Discovery supplies a sourced opportunity. The application combines those inputs with the actual funder questions. Human decisions govern changes, approval and the record of what was submitted. Each stage should retain its context instead of making the user start again.

The essential boundary

Beedy prepares and supports the work. Internal approval and export do not submit an application to a funder. A person completes the funder’s process and separately confirms the actual submission in Beedy.

Reading route

Pages 2-4 cover setup, reusable knowledge and discovery. Pages 5-7 cover conditions, application requirements and budgets. Pages 8-10 cover writing, review and export. Pages 11-12 cover submission records, outcomes and continuing work. The document is based on the approved scope and source evidence available on 5 November 2026.

01 Set up the organization

Start with what the customer knows

The user starts

Identify the organization and provide the information already available about its mission, people and work. A new or small organization should not need a complete grant library before it can begin. For a fiscally sponsored project, keep the project’s identity separate from the sponsor’s legal identity and tax information; the project does not need its own EIN.

Beedy should assist

Offer progressive setup with editable information, visible progress and the ability to return later. Public registry information is a proposed starting point for review, not automatically authoritative. If a lookup fails, allow a manual or tentative path and show what remains unconfirmed. Missing information should prompt a useful next question rather than a blanket stop.

Choose the level of guidance

Let the user choose among the approved guidance levels, including guidance off, and use clearly labeled practice when useful. Practice content must not be confused with a real application. Setup may include assisted onboarding, but the intended ongoing journey should not require routine per-grant staff rewriting.

Invite the right help

Add authorized teammates with appropriate organization or application access. Editing, final approval and submission or outcome recording are different responsibilities. Give each person only the authority they need; a collaborator who writes answers does not automatically become the final approver.

Continue when

The organization is identifiable, the immediate goal is clear and the user can review the information Beedy will use. Do not make a complete plan or a universal document pack a condition for exploring grants or starting gap-aware preparation. The next step is to build reusable context as the work demands it.

02 Build reusable knowledge

Turn documents and notes into reviewed context

The user contributes

Upload relevant organization and program material or enter information directly. Useful sources may include mission statements, financial records, governance material, program plans, past proposals, reports and writing samples. Explain what is unavailable or not applicable. These are useful categories, not a mandatory pack for every customer.

Beedy should assist

Extract usable information and show its source, scope and applicable period. Partial extraction, unreadable scans and unsupported content need honest states and a retry or alternate-input path. An upload date is not the date the document’s facts became true. A user’s description of an unclear image remains an attributed statement rather than independent verification.

Review before reuse

The user corrects extracted information and selects the authoritative facts and sources for the organization or program. Conflicting figures should remain visible until resolved. A new file with the same name should not silently replace the older record. Information from different fiscal years or programs must not be blended into one supposedly current fact.

Develop the program

Build a living description of the work: the need, proposed activities, people, timing, intended outcomes and resources. Reuse this record across applications while keeping proposed plans distinct from past accomplishments. A leader’s previous experience is not automatically the organization’s track record.

Keep control of changes

Corrections should identify affected applications and offer changes for adoption, not silently rewrite them. Withdrawing a source should stop future use while preserving appropriate history and human-authored text. The result of this stage is reusable, reviewable context, with missing facts visible for later follow-up.

03 Discover a suitable opportunity

Move from a broad search to a deliberate choice

The user searches

Explore funding for the whole organization, a particular program or a new idea. Combine relevant filters such as geography and amount. Review and save promising leads, adjust matching preferences deliberately, and distinguish passing on one round from rejecting all future rounds.

Beedy should assist

Show a sourced catalog with the information needed to assess the lead: funder, purpose, amounts, dates, applicant route and known conditions. Present fit, funding potential, effort and eligibility as distinct considerations. A missing fact means unverified, not automatically ineligible. Sparse results should remain sparse rather than be padded with weak or invented opportunities.

Check the basis

Open the official source and inspect freshness, coverage, uncertainty and conflicting information. A failed refresh does not prove that funding has closed. A forecast of a future round is not an announced current round. A credible incomplete lead can be worth saving, but a recommendation to apply needs current requirements checked.

Bring in a lead from elsewhere

The approved journey also accepts an opportunity supplied through a link, email, document or manual entry. It should enter the same review and application path with provenance, duplicate checks and visible conflicts. User-supplied information should not silently replace conflicting official guidance.

Make the next decision

Choose whether to investigate further, save for later, pass on the current round or pursue. Where the next step is an inquiry or invitation, show that actual route. A suggested introduction is not a mandatory contact step. Beedy should not contact the funder, choose Pursue or start paid drafting just because someone opened a grant page.

04 Understand the conditions

Read written rules against the organization’s actual situation

The user checks

Before committing effort, review the funder’s eligibility, ineligibility and prerequisites for the selected cycle and applicant track. Compare them with the organization’s known facts, including other applications and awards. Resolve material unknowns rather than treating a good match as permission to apply.

Beedy should assist

Explain each relevant condition with the official source link and supporting wording. Show unmet, conflicting, stale or unknown information beside the grant and in the relevant application. Ask for the specific missing fact or evidence. The approved conditions addition is a target behavior; extraction from every source is not guaranteed or verified.

Required sessions and optional help

An actual attendance prerequisite should be labeled “Required information session.” Optional funder draft review or preparation help should be labeled “Optional application review help available.” Other optional sessions stay optional. Show published dates, timezone, format, registration route, deadlines and waiver conditions when available. Do not invent missing details or assume attendance from a registration click.

Cross grant restrictions

Distinguish a rule against applying to two programs from a rule against holding both awards. Check whether a restriction concerns overlapping funded periods, duplicate costs, completion, closeout or an explicit cooldown. A pending application is not an award, and an award is not money received. Only calculate an earliest possible next date when the rule and all required date inputs are known.

Decide with the evidence

Record supported completion or waiver evidence for required steps. Keep optional help visible without making it a readiness requirement. A passed date or an absence of recorded conflicts is not an eligibility guarantee. The smART and Arts in Parks example in the source discussions is illustrative only; no specific rule for either program is established here.

05 Start the application

Carry the grant context into actual questions and a checklist

The user chooses Pursue

Start an application for the chosen opportunity and cycle. The application should retain the source context and uncertainties that informed the decision. Selecting Pursue is a deliberate commitment to organize the work, not automatic external submission or permission to begin paid drafting.

Beedy should assist

Bring the relevant grant details, requirements, amounts, restrictions and milestones into the application. Check the original source or visibly disclose unavailable or stale information. Later source changes should appear as proposed application updates with the previous basis retained, rather than silently replacing adopted requirements or prose.

Adopt the real requirements

Use publicly available actual questions when they can be acquired, or supply the form through upload or manual input. Review wording, order, subquestions, answer type, limits and attachment instructions before adoption. Generic preparation can help while a form is unavailable, but must not masquerade as the funder’s official question set or a complete ready package.

Work from the application status

The intended per-application view brings together requirements, user actions, dates, deadlines, eligibility conflicts and optional help. A sourced checklist should name owners, deadlines, completion evidence and uncertainty for relevant forms, attachments, registrations and portal steps. The next required unsatisfied milestone matters more than the final deadline alone.

Bring new information back

Add meeting notes, a transcript or direct information through existing upload and typed-input routes. Review and adopt relevant changes, with user-provided information attributed and conflicts shown. A transcript alone does not establish that attendance requirements were satisfied. Confirm what remains to be done before drafting against the adopted requirements.

06 Shape the program and budget

Make the narrative and the numbers describe the same work

The user develops the plan

Clarify activities, staffing, dates, participants, intended results and assumptions. Reuse the living program record rather than creating unrelated versions for every funder. Identify which information describes completed work, which is a proposal and which is still unknown.

Beedy should assist

Build a reusable full-cost line-item budget and check it against the actual funder’s rules. Help reconcile the funding request, total project cost and other support. Keep quantities, units and assumptions understandable so the user can inspect why a total changed. Do not treat a plausible estimate as an established financial fact.

Handle other funding accurately

Track potential, requested, awarded and received support separately. Allocate costs across sources without double counting the same expense. Distinguish competing funding alternatives from amounts that can legitimately be combined. If the funder restricts eligible costs or concurrent awards, show the supported constraint instead of inventing a workaround.

Explore a feasible alternative

The approved planning scope includes cash timing, restricted and unrestricted funds, and bounded scenarios such as a lower award, phased delivery or a delayed start. Beedy should explain the effect on the plan and propose changes for review. A scenario remains tentative until adopted; adopting it does not make a forecast true or secure the proposed funding.

Carry decisions into the application

When the user adopts a budget or program change, identify affected answers, commitments and review needs. Check the application as a whole so that participant totals, dates, requested amounts and promised activities remain consistent. This is application and program planning support, not a promise of full accounting or post-award administration.

07 Draft the application

Create a coherent case from the adopted material

The user starts drafting

Select the application context and initiate the drafting work deliberately. Use the adopted actual questions, relevant organization and program knowledge, budget and selected writing samples. Review visible usage allowances where applicable; do not treat a saved lead or an opened page as consent to spend them.

Beedy should assist

Prepare answers that address the funder’s wording and subquestions while making one coherent case across the application. Reuse supported facts appropriately, respect the organization’s writing voice and check against the adopted requirements. Clearly distinguish evidence, user statements, plans, estimates and unresolved gaps.

When evidence is missing

Ask targeted questions, point out weak support and leave uncertainty visible. Do not manufacture accomplishments, partner commitments, participant counts or eligibility facts. Gap-aware preparation should remain useful, but unresolved placeholders alone are not the intended finished customer outcome.

Prepare required attachments

The approved scope includes drafting supported application-package attachments when the funder calls for authored material. A narrative attachment is different from a document that must be supplied by the user or an issuing organization. Beedy must not fabricate official records, signatures or technical certifications. The exact supported attachment types and output formats still require verification.

Respect the funder’s rules

Read applicable instructions, including restrictions on AI use, and keep them visible in the workflow. Supporting research should be assessed for relevance and evidence quality rather than inserted merely because it is available. Proposed outreach and meeting-preparation text remain drafts for a human to use; preparation does not authorize sending.

Stay in control

The intended journey allows interruption and later continuation without losing accepted work or overwriting human writing. A user should be able to see what is complete, what needs input and whether an operation actually finished before deciding to continue.

08 Edit and review in context

Improve the text without losing ownership

The user edits

Read and revise the application directly. Ask Beedy for a focused change to a selected passage or answer, discuss a concern in context and compare the proposed wording with the current text. Accept only the changes that fit the organization’s meaning and evidence.

Beedy should assist

Keep AI suggestions separate from accepted content. Preserve human edits, revision history and attributable comments or review decisions. A newer draft should not silently overwrite an accepted answer. If two people or two copies change the same passage, show the conflict for resolution rather than claiming that every edit was safely combined.

Check more than the selected paragraph

A changed number, date, negation or commitment can affect other answers, the budget and supporting evidence. Beedy should identify these effects and propose the relevant updates. A stylistic improvement is not permission to strengthen an unsupported claim or alter a commitment.

Choose the editing surface

Native Beedy editing, contextual Google Docs editing and Word on Windows, Mac and the browser are all in the approved target. The source evidence does not verify the complete external-editor experience. Treat those integrations as required but unverified, not as currently available features or as something a download alone satisfies.

Know what is saved

The intended experience distinguishes a local save, a Beedy save and the synchronized version in an external editor. If connection or synchronization is uncertain, preserve the work and clarify what still needs checking. Reviewing an old snapshot is not the same as reviewing the latest host document.

Finish this stage

The user has readable answers, visible support and resolved or explicitly acknowledged issues. Beedy should make the current package ready for a meaningful human review, not declare it approved because an AI pass completed.

09 Approve and export the package

Make the final decision about the exact version

The user reviews

Inspect the current answers, budget, attachments and sourced checklist together. Check the actual form’s limits and instructions. Make sure required registrations, sessions or other prerequisites have real completion or waiver evidence, and distinguish an advisory concern from an unmet funder requirement.

Understand Ready

An actual unmet funder requirement blocks Ready, while editing and download remain available. Missing independent support is a different issue: an authorized human attestation may permit an otherwise compliant package to be Ready, but the claim must remain visibly unverified. Attestation cannot make a genuine eligibility failure or missing required attachment disappear.

Obtain the right approval

An administrator or specifically authorized delegate approves the current reviewed package. Writing access alone does not grant final approval. Authorized mobile final approval is part of the intended scope, but must still apply to the exact reviewed version and current permissions. A material later change requires the affected approval to be revisited.

Export clean material

Beedy should produce the customer-facing package from the captured version, preserving intentional citations and funder-required references while removing internal review markers, comments and support annotations. The answers, attachments and checklist must agree. Supported formats and fidelity need to be declared from tested behavior, not assumed from this guide.

Before leaving Beedy

Inspect the actual files or answers that will go to the funder. A non-ready draft may still be downloaded with its warnings; download is not a readiness decision. Arbitrary printing or exporting from an external editor should not be assumed to carry Beedy’s clean-output assurance.

Keep the distinction

Internal approval authorizes the package within the organization. Export makes material available to use. Neither action sends anything to the funder or establishes that a submission happened.

10 Submit and record what happened

The external action and the Beedy record are separate

The user submits externally

Follow the funder’s actual submission route, such as its portal or specified delivery process. Complete any final fields, uploads and declarations there. Beedy’s approved MVP does not automatically submit, register for a session, book a meeting, contact a funder or withdraw another application through the conditions workflow.

Record the actual submission

After submission, an authorized person confirms what was sent and when. The selected materials may be the latest Beedy version, an older version or a file finalized outside Beedy. The record should preserve the exact submitted set rather than assuming it was whatever happened to be current in the workspace.

Beedy should assist

Keep a durable record of the submitted contents, actor and date, with optional receipt or confirmation evidence. An export or uploaded receipt alone must not change the application to Submitted. Submission recording has its own grant of authority and is distinct from final approval; the appropriate authorized recorder can capture the event without requiring the executive director to perform it in the product.

Record truthfully even with gaps

If a real submission happened while issues remained unresolved, record that fact with those gaps. Do not invent retrospective Ready status or approval. A readiness safeguard should prevent a false readiness claim, not prevent an accurate history of what the organization did.

Correct or resubmit carefully

Correct a mistaken submission record without erasing its original history. A genuine resubmission should create a linked second package and submission date, preserving the differences and allowing an optional reason. Do not quietly replace the first submitted package with later edits.

The first submission is complete when

The funder-facing action has actually occurred and the organization has an accurate record of its submitted materials. Beedy’s preparation journey and the human’s external action now connect through a truthful, reviewable history.

11 Continue the funding cycle

Reuse learning without losing the original history

Record the outcome

When known, record an outcome such as not funded, awarded and declined, or awarded and accepted. Keep unknown outcomes unknown, and distinguish awarded money from received funds. Optional feedback and supported results can inform future work without turning every anecdote into a verified success claim.

Use feedback deliberately

Beedy’s intended scope includes policy-aware feedback-request drafts after known outcomes. No-contact or no-feedback rules should suppress inappropriate suggestions. Drafting, sending and sharing a reply for improvement are separate permissions. Do not assume that participation grants permission to train on organization material.

Keep reusable records current

Bring corrected facts, program changes, funding results and new documents into the same review and adoption process. Recheck applicability before reusing an old narrative, budget or attachment. Known awards can change eligibility for another opportunity, so the conditions check belongs in the ongoing loop as well as the first application.

Choose the next work

Use saved leads, funder watching and customer-selected discovery refresh. Pursue is intended to enable deadline emails at one calendar month, two weeks, one week and two days, adjustable in Settings. This is existing approved reminder scope, not a new scheduling service. Review what the release actually supports; this guide does not verify sending behavior.

Pause or start a new cycle

Archive work when appropriate, preserving it for reading and download while stopping active work and suspending its reminders. Resume explicitly to edit again, with current rights and dates checked. For a new round or another attempt, retain the earlier record, validate reused facts and requirements, and make a fresh pursue decision. A prior pass does not decide the new cycle.

Source and scope note

Based on Beedy MVP Requirements and Gap Comparison, prepared 4 November 2026, version 3; Beedy MVP Feature Inventory, 5 November 2026; and the approved Beedy MVP Grant Conditions Addendum version 1.0, 5 November 2026. Status is qualified by the supplied 5 November remaining-work report. These are documentary sources, not a live release audit. Full post-award administration, automatic funder submission and unverified universal formats are not promised by this guide.
