CENTRING / STRATEGY & EXECUTION / 06 NOVEMBER 2026

Neo-fundraising

A category strategy and Databricks execution playbook for Beedy

Turn organizational knowledge into stronger funding decisions, stronger applications and a repeatable path to funding.

The ambition: make **Neo-fundraising** a recognized approach to grant fundraising, with Beedy as the product that makes it practical for nonprofits.

The investment: use the confirmed **$50,000 in Databricks credits** to develop and demonstrate better grant matching, evidence-backed writing and application review. Build an advantage customers can experience and the team can measure.

Prepared for the Centring team

Business positioning, Blue Ocean choices, competitive evidence, product priorities, model development, credit allocation, customer validation and a 90-day operating plan.

Working strategy v1.0 | Proposed decisions and targets are labeled throughout. This document does not establish live product functionality, competitive superiority, trademark availability or a grant-win guarantee. No infrastructure was deployed and no credits were spent to prepare it.

01 / EXECUTIVE DECISIONS

The play in one page

Win the existing grant-writing business by making the underlying funding practice better.

Category: Neo-fundraising is a knowledge-driven, evidence-backed approach to grant fundraising in which each application builds reusable capability for the next. Beedy is the product; Centring is the company; Databricks is an enabling platform.

Initial customer hypothesis: an operating nonprofit with credible programs, recurring grant opportunities and a small development team that repeatedly reconstructs information. The first buyer is the executive director or development lead. Validate this with customer work, not revenue size alone.

Competitive wedge: demonstrate a better connected journey from organizational evidence to a justified pursue decision and a reviewable application. AI writing and stored context alone are already competitive features. Superiority remains a hypothesis until a fair comparison proves it.

Decision	Recommended starting position
What to build first	An evidence-backed grant-readiness and drafting workflow for a narrow set of nonprofit grants.
How to use Databricks	Evaluate current models, organize authorized examples, improve retrieval, then fine-tune a bounded task if the evidence supports it.
How to use $50,000	Release credits in stages. Reserve $10,000; test training with a conditional $12,000 envelope rather than an automatic spend.
How to sell	Sell Beedy directly on relevant grants, stronger applications and reduced preparation burden. Test the category language alongside familiar grant-writing language.
What proves progress	Expert-reviewed quality, fewer material errors, less human correction time, paid conversion and repeat application use.

The near-term objective is a repeatable product advantage. Broader adoption of the category follows customers, evidence and consistent teaching. A new name and a cloud platform do not create a defensible category on their own.

Evidence basis: user-confirmed credits and access; supplied Beedy documents [S1-S2]; current competitor and Databricks sources [S3-S10].

02 / READING GUIDE

How to use this playbook

Pages	Team discussion
4-8	Define Neo-fundraising, select the initial customer, understand competition and apply Blue Ocean choices.
9-11	Agree on positioning, the customer promise and the demonstration that makes the promise tangible.
12-15	Design the Databricks boundary, data contracts, model experiments and evidence required to ship.
16-18	Allocate credits, test commercial economics and organize the first 90 days.
19-22	Turn strategy into backlog, customer acquisition, proof and durable advantage.
23-25	Resolve risks, run the kickoff workshop and execute the first two weeks.
26-27	Check sources, assumptions and the boundary between evidence and proposals.

Three labels govern interpretation

• **Confirmed:** supplied by the user or directly stated in the provided documents or cited source. Documentary statements about intended functionality are not live verification.

• **Hypothesis:** a customer, positioning or differentiation claim that needs testing. The proposed initial segment and category whitespace fall here.

• **Proposed:** a budget, target, design or work assignment offered for team decision. None is a Databricks quote or an existing team commitment.

Read for a decision, not just agreement

Leadership should leave with one target customer and one promise to prove. Engineering should leave with a bounded experiment and explicit storage boundaries. Product should leave with a quality rubric and acceptance cases. Commercial work should leave with a paid-pilot offer and a repeat-use definition.

Keep the business focused: Beedy helps nonprofits pursue suitable grants and prepare stronger applications. This plan does not introduce a separate data-licensing, sponsorship or banking product.

03 / CATEGORY DEFINITION

What Neo-fundraising means

A proposed category definition Centring can teach, operationalize and test.

Neo-fundraising is a knowledge-driven approach to grant fundraising that connects an organization's evidence, funding choices, application work and learning across funding cycles.

The word should describe a recognizable practice. A nonprofit should understand what changes in its work: fewer repeated questions, more deliberate pursuit, stronger supported answers and useful continuity after submission. Explain the term in ordinary grant language every time it is introduced.

Five principles

• **Know the organization.** Maintain reviewed facts about mission, programs, finances, results and voice, with source and period attached.

• **Choose deliberately.** Separate fit, eligibility, effort and funding potential. Investigate material unknowns before investing heavily.

• **Write from evidence.** Answer the actual funder questions using adopted facts, program plans and budgets. Keep aspirations distinct from accomplishments.

• **Keep people accountable.** Human review, approval and external submission remain meaningful decisions.

• **Carry learning forward.** Reuse approved knowledge and reported feedback while checking freshness and permissions.

Scope discipline

Launch the category through grant fundraising. The term is broad enough to suggest individual giving, donor CRM and capital campaigns, but Beedy should not imply support for those areas before they are deliberately added. Use the descriptor **Neo-fundraising for nonprofit grants** in early messaging.

A limited web scan did not establish a clearly competing grant-software category under the exact term. That is not proof of originality, exclusivity or name availability. Treat the name as a proposed category label; obtain separate name clearance before claiming exclusive ownership.

Definition and principles are original strategic proposals informed by the intended journey [S1-S2]. Name research scope and limitations are recorded on page 27.

04 / CUSTOMER & DEMAND

Start with one painful buying situation

A Blue Ocean opportunity begins with a customer who cannot get the job done well enough today.

Proposed initial segment: small development teams in operating nonprofits with a defined program, usable organizational records and recurring foundation or local grant applications. A near-term real opportunity provides a concrete buying trigger. Do not force a complete historical proposal library as the price of entry.

Customer situation	Why it matters	Test in discovery
Knowledge scattered across files and people	Reconstruction consumes scarce staff time.	Walk through the last application; identify repeated work.
Good program, inconsistent applications	Strong delivery may not translate into a clear funding case.	Have an expert review actual answers and missing evidence.
Few development staff	Time saved can unlock more careful preparation.	Measure hours and interruption burden, not just drafting speed.
Several recurring opportunities	Reusable knowledge can create continuing value.	Observe a second application, not only onboarding.
Buyer owns preparation and budget	A clear owner can evaluate and purchase.	Confirm buying authority, timing and willingness to pay.

Noncustomers to investigate

Explore organizations that avoid grant software because setup is too demanding; teams using general AI but distrust unsupported prose; and nonprofits whose grant activity depends on one overextended leader. These are hypotheses about unmet demand, not a measured market size.

Avoid stretching the first pilot

Separate complex scientific applications, highly specialized federal compliance and organizations without an identifiable program from the initial cohort. They may become customers later. Start where Centring can verify the entire experience and support burden.

Do not infer willingness to buy or grant readiness from the earlier nonprofit list alone. Use it as a prospect-research starting point, then qualify the actual situation.

05 / COMPETITIVE REALITY

Compete against what exists

Public positioning checked 5 November 2026; this is not a hands-on product audit.

Competitor	Published positioning / capability	Implication for Beedy
Instrumentl	Combines discovery and grant workflow; Apply uses prior materials and funder insights for drafting and refinement. [S3-S4]	Organizational context, AI writing and an integrated journey are not sufficient differentiation.
Grantable	Presents a broader workspace spanning AI writing, funder discovery, documents and collaboration. [S5]	Do not position it as merely a generic text generator.
Grantify	The reviewed grantify.io site emphasizes UK startup funding and a guided application process. [S6]	Treat it as a user-named competitor with potentially different buyer and geography; confirm the exact offering in interviews.
General AI + documents	A substitute customers can assemble themselves; quality depends on their workflow and review.	Demonstrate less reconstruction, clearer evidence and less correction on real tasks.

Instrumentl lists Discover at $299/month, Pre-Award at $499/month and Full Lifecycle at $999/month when paid annually; monthly-payment prices differ. These are observed list prices, not effective quotes or recommended Beedy prices. [S3]

Where the contest should move

Test whether Beedy performs better when evidence is incomplete, facts change between applications, conditions conflict, or a strong narrative must agree with the budget. These are proposed grounds for differentiation; the research does not establish that competitors lack them.

A fair competitive test

Use authorized access, the same organization packet and the same grant questions. Record product tier, setup effort, available features and evaluator time. Blind the output review where practical. If a feature cannot be tested, record unknown rather than absent. Never publish a superiority claim from an unequal comparison.

Competitor summaries are limited paraphrases of public sources. Recheck before sales use. Grantify identity and market overlap remain an explicit validation item.

06 / BLUE OCEAN CHOICES

Change the basis of value

Apply Eliminate-Reduce-Raise-Create to the customer experience, rather than adding an unlimited feature list.

Choice	Proposed action	Business consequence
ELIMINATE	Repeated intake for information already reviewed; unsupported certainty; automatic pursuit based on a loose match.	Less avoidable work and fewer misleading recommendations.
REDUCE	Low-fit opportunity volume, irrelevant drafting, setup requirements and routine staff rewriting.	Lower customer effort and lower cost to serve.
RAISE	Source traceability, rule precision, cross-answer consistency and useful gap identification.	Make quality visible enough to justify purchase and retention.
CREATE	A continuous, user-controlled funding practice: organizational memory, deliberate pursuit, evidence-backed applications and reuse.	Give Neo-fundraising a tangible method and repeat-use story.

The Blue Ocean hypothesis

The opportunity is to help constrained teams perform a disciplined grant practice they currently struggle to sustain. It is not enough to move existing buyers between similar writing tools. Test whether reduced setup and reconstruction bring reluctant or underserved users into consistent grant work.

Value innovation requires cost discipline

Better review should reduce expensive correction and customer support. Reusable facts should reduce onboarding effort on subsequent applications. A model improvement that increases infrastructure complexity without improving customer quality or operating cost weakens the strategy.

Avoid fabricated competitor scores on a strategy canvas. Use the proposed allocation on the next page as an internal choice; populate external comparisons only after observation.

Framework attribution: the Eliminate-Reduce-Raise-Create grid is a Blue Ocean Strategy tool [S7]. The application here is Centring-specific analysis, not evidence that uncontested demand has already been found.

07 / STRATEGIC ALLOCATION

Where Beedy should concentrate

A proposed value profile, not a measured market ranking.

Factor	Priority	What the team should deliver
Reviewed organizational knowledge	Very high	Facts with source, scope, period and adoption history.
Quality of pursue decisions	Very high	Fit and conditions explained, with an actionable next step.
Application substance and consistency	Very high	Question coverage, supported claims and a coherent budget.
Time to useful first value	High	A usable shortlist or reviewed answer without a mandatory document mountain.
Reuse on the next application	High	Less repeated work with current facts and explicit review.
Database breadth	Sufficient for chosen segment	Documented coverage and freshness before national completeness.
Volume of generated prose	Low as a success metric	Only produce writing that advances a real application.
Post-award accounting breadth	Outside current focus	Preserve the intended MVP boundary.

The strategic tradeoff is deliberate: choose depth on a bounded funding journey before claiming comprehensive coverage. If the target segment cannot find enough suitable grants in that coverage, expand the source set or change the segment before scaling acquisition.

When the hypothesis fails

Reconsider the category wedge if buyers understand Neo-fundraising only as a synonym for AI writing; if the second application is no easier; if expert review finds no material quality benefit; or if routine staff intervention is required to finish ordinary applications.

The desired customer verdict: "Beedy knows what we can substantiate, helps us choose where to spend our effort, and makes the next application easier."

08 / POSITIONING & LANGUAGE

Make the category understandable

Lead with the customer job. Use the category name to organize the promise.

Positioning statement - proposed

For nonprofits with real programs and limited fundraising capacity, Beedy turns organizational knowledge into a repeatable grant practice: finding suitable opportunities, preparing evidence-backed applications and carrying learning into the next funding cycle.

Brand layer	Role	Suggested wording
Centring	Company and accountable builder	Built by Centring.
Beedy	Product the customer uses and buys	Beedy helps nonprofits prepare stronger grant applications.
Neo-fundraising	Method / category to establish	A knowledge-driven way to pursue grants and improve with every application.
Databricks	Technical enabler	Supports evaluation and model development; mention deployed uses only when verified.

Homepage concept - proposed copy

Build your next grant application on everything your organization already knows.

Beedy brings your organizational knowledge, grant requirements and writing into one guided process, helping your team choose suitable opportunities and prepare a stronger, reviewable application. Meet Neo-fundraising for nonprofit grants.

Proof before promotion

Use "designed to" for capabilities still being built. Replace it with a concrete, measured claim after validation. Avoid guaranteed funding, invented win probabilities, universal eligibility coverage, or claims to be the first or only provider without substantiation.

Test the category name against a familiar descriptor such as "evidence-backed grant preparation." Keep whichever language improves comprehension and qualified interest; the name should support conversion rather than require a long explanation.

09 / PRODUCT EXPERIENCE

Make the method visible in the journey

These are proposed product priorities mapped to the intended Beedy experience, not a release audit.

Journey	Visible experience	Databricks development contribution
Onboard / knowledge	Review proposed facts; see gaps and source periods.	Evaluate extraction and retrieval using authorized examples.
Discover / choose	A manageable shortlist with fit, unknowns and effort.	Compare ranking strategies against expert labels.
Requirements / prepare	Actual questions, prerequisites and missing evidence.	Evaluate structured extraction and difficult condition cases.
Draft / review	Answers supported by adopted knowledge and consistent numbers.	Compare prompts, models and targeted fine-tuning.
Approve / export	Review the exact package; preserve human control.	Evaluate quality checks; application enforces permissions.
Submit / outcome / reuse	Human records actual submission; known results inform later work.	Analyze permitted feedback and repeated failure patterns.

Preserve the existing distinction between a useful draft and a package that meets actual requirements. Missing support can be surfaced for human review; a real unmet prerequisite should not disappear because a model produces polished wording.

Do not make the user understand Databricks to benefit. The interface should show the relevant fact, source, uncertainty and next action. Platform architecture belongs in the team plan, not the ordinary nonprofit workflow.

Mapped from the supplied journey guide and grant-conditions addendum [S1-S2]. The intended human submission boundary remains unchanged.

10 / DEMONSTRATION

One story that proves the difference

Illustrative scenario; all organizations, grant rules and numbers here are fictional.

A youth-services nonprofit wants support for an after-school program. Its current plan serves 120 participants, while an older proposal says 80. A prospective funder requires an information session and does not allow the same expense to be funded twice.

Moment	What the demonstration shows
1. Establish knowledge	Beedy identifies the conflicting participant counts and asks which plan is current; it retains both sources and their periods.
2. Assess the opportunity	The program appears relevant. Attendance remains unknown because registration is not proof of attendance.
3. Prepare the application	A staff cost may overlap with another award. Beedy identifies the specific line and requests the funding allocation.
4. Draft and review	Answers use the adopted participant count and budget. Unsupported accomplishments remain questions rather than invented claims.
5. Change a fact	An approved budget update identifies affected answers for review without overwriting human edits.
6. Reuse	A second opportunity reuses current approved facts and rechecks the new funder's requirements.

How to evaluate the demo

A grant professional checks the factual decisions and answer quality. A nonprofit user completes the workflow with measured assistance. Engineering records evidence retrieval, latency, errors and cost. Save the baseline so the same case can be rerun after changes.

The demo succeeds when the user can explain why the application is stronger and what still needs attention. Fluent prose alone is not sufficient.

The scenario reflects intended distinctions in [S1-S2]. It is not an actual funder policy or customer result.

11 / ARCHITECTURE

A bounded Databricks addition

Start in development. Integrate only the parts that demonstrate value.

Layer	Recommended responsibility
Beedy + PostgreSQL	Authoritative workflow state: organization records, adopted facts, applications, versions, permissions, approvals and submission records.
Authorized source storage	Original documents and evidence according to the selected custody and retention design.
Databricks experiment environment	Authorized evaluation data, experiment results, candidate training runs and bounded derived assets.
Retrieval and models	Versioned components behind a narrow interface; existing production path remains available during comparison.
Beedy user experience	Present the evidence and proposed changes; enforce user decisions and application permissions.

The review specifies PostgreSQL as the target for persistent stores, including discovery, and records existing shared Foundry inference. Durable Databricks tables, traces, indexes or model artifacts introduce additional persistence. Document that exception before production use instead of treating it as an invisible analytics detail. [S2]

Suggested first integration contract

Send an authorized, versioned input packet and task identifier. Receive proposed structured results with source references, model version, uncertainty and cost metadata. Validate the response before the application offers it for adoption. Make retries idempotent and preserve the prior accepted result.

AI Search can support retrieval from an indexed corpus. It does not acquire the public web, replace the crawler or establish that a grant is current. Source discovery, retrieval, extraction and freshness remain distinct responsibilities. [S9]

This is a proposed design. No workspace configuration, deployed topology or feature entitlement was inspected for this report.

12 / DATA FOUNDATION

Create useful, authorized learning material

Data quality and labels will constrain progress before GPU capacity does.

Asset	Minimum record	Use
Organization fact	Tenant, program, fact, source, period, reviewed status, version.	Retrieve the right evidence without blending years or organizations.
Grant condition	Funder, program, cycle, track, source passage, check date, rule type.	Separate required, optional, conflicting and unknown states.
Question / answer example	Exact question, constraints, input evidence, expert-approved response, rubric.	Evaluate and potentially fine-tune a bounded writing task.
Correction example	Original output, correction, reason, reviewer and source basis.	Identify systematic errors and prioritize model work.
Outcome record	Actual submitted version, outcome status, date, amount type and provenance.	Analyze results without confusing unknown, awarded and received.

Use public material with appropriate reuse rights, commissioned expert examples, and synthetic cases checked by people for the first experiments. Public availability does not automatically permit every form of training or redistribution. Record permitted purpose and provenance with each admitted dataset.

The current review excludes customer-data model training. User confirmation that credits support model development does not itself change that product commitment. If Centring later chooses an opt-in training program, define the permission and withdrawal design before admitting those records. [S2]

Protect evaluation validity

Split by organization, funder and time where feasible. Keep near-duplicate proposals out of both training and test sets. Hold out a final test set before tuning and retain difficult negative cases. Synthetic-only success is insufficient evidence of real customer performance.

13 / MODEL DEVELOPMENT

Train the task that needs improvement

Use the $50,000 to test a differentiated system, including focused fine-tuning when justified.

Stage	Experiment	Advance when
1. Baseline	Existing model + explicit prompts + evidence retrieval.	Errors and customer correction effort are categorized.
2. Retrieval	Structured filters, hybrid search and evidence selection.	Relevant evidence is found more reliably on held-out cases.
3. Task tuning	Fine-tune a small candidate for one stable behavior, such as condition classification or answer structure.	Authorized examples exist and the baseline shows a recurring deficiency.
4. System comparison	Compare baseline and tuned candidate with equal evidence.	Quality improves without unacceptable cost, latency or safety regressions.
5. Production decision	Shadow or limited rollout with rollback.	Customer benefit persists beyond the development examples.

Keep changing facts, grant deadlines and private organizational knowledge in governed retrieval and application records. Fine-tuning is better considered for repeatable behavior than for memorizing a changing grant catalog. Training from scratch is not the recommended use of this budget.

Databricks now directs new foundation-model training work to AI Runtime; its former Foundation Model Fine-tuning interface is marked end of life. The October 21, 2026 announcement reports AI Runtime general availability, but availability, cloud, region, quota and credit coverage must be checked in Centring's workspace. [S10-S12]

Training admission gate

Require an identified baseline failure, approved dataset purpose, isolated holdout, bounded run budget and a predeclared success threshold. Start with a small experiment. Stop if gains vanish on unseen organizations or merely make the prose more polished.

14 / QUALITY & ACCEPTANCE

Prove the advantage before shipping it

Proposed pilot gates; calibrate with expert reviewers before treating them as release commitments.

Measure	Proposed gate / method
Mandatory conditions and deadlines	At least 95% exact or adjudicated-correct extraction on a held-out set; report sample size and each error type.
Critical fabricated claims	Zero observed invented requirements, eligibility guarantees or accomplishments in release test cases; sample success is not universal proof.
Evidence support	Every material recommendation has a supporting source or an explicit unknown; experts review whether citations actually support the claim.
Writing quality	Blind expert comparison on responsiveness, specificity, support and consistency; report ties and disagreement.
Human effort	Target 25% lower median correction time on matched tasks, with quality maintained; proposed target, not a forecast.
Isolation and change handling	Pass tenant canaries, withdrawn-source, changed-rule and human-edit preservation cases.
Cost and latency	Measure per reviewed task and per completed application; compare against the approved commercial budget.

Start with approximately 100 carefully labeled cases spanning ordinary and difficult tasks. Two reviewers should adjudicate critical disagreements. Keep reviewers blind to the candidate where possible. Report absolute counts alongside percentages and avoid a single aggregate score that hides serious failures.

MLflow supports trace-based evaluation and repeatable scorers. Combine programmatic checks, expert labels and model judges; model judges are supporting instruments, not the final authority for factual or eligibility correctness. [S8]

Release performance, adoption and award outcomes are different levels of evidence. None should be substituted for the others.

15 / CREDIT ALLOCATION

A staged plan for $50,000

Proposed credit envelopes, not vendor pricing, a quote or a promise that every line is covered.

Workstream	Envelope	What spending should produce
Evaluation and baseline experiments	$8,000	Reproducible quality measurements and failure analysis.
Source processing and retrieval	$10,000	A bounded, sourced corpus and evaluated evidence retrieval.
Targeted model training	$12,000	A limited set of candidate runs with held-out comparisons; conditional on the training gate.
Pilot inference and monitoring	$7,000	Measured customer task quality, latency and serving cost.
Performance and cost experiments	$3,000	A lower-cost operating configuration with comparable quality.
Uncommitted reserve	$10,000	Capacity for the strongest demonstrated opportunity or unexpected costs.
TOTAL	$50,000	Spend against decisions, not credit-consumption targets.

These envelopes cover eligible platform consumption only. Engineering, expert labeling, customer recruitment, outside model services and cloud charges may require separate cash funding. Confirm the credit terms before treating any specific charge as covered.

Release credits in tranches

Authorize an initial maximum of $5,000 within these envelopes for baseline and feasibility work. Review quality and actual billing before releasing the next $10,000. Further tranches depend on a documented result and revised estimate. The reserve stays uncommitted.

Tag experiments by task and owner; record actual versus expected spend weekly; configure available budgets, quotas and workload limits. Verify enforcement rather than assuming billing alerts stop jobs. Record credit expiry and remaining balance at each review.

If training is not justified, retain or reallocate that envelope deliberately. Unused credits are preferable to an unmaintainable production dependency.

16 / COMMERCIAL MODEL

Sell the outcome; measure the economics

Keep the revenue model tied to Beedy grant preparation and ongoing reuse.

Proposed offer: a paid pilot for one real application followed by an organization subscription if the customer chooses to continue. State the included workflow, support, usage and deliverables clearly. Do not price success as a guaranteed award.

Pricing discovery before a price list

Interview qualified buyers about current preparation costs and the purchase they can authorize. Test a clear paid offer at a price the team selects. Actual commitments matter more than hypothetical enthusiasm. Compare willingness to pay with support and computing costs, not just competitor list prices.

Economic question	Calculation / observation
Customer value	Preparation hours saved x customer's own value of time, plus observed reduction in rework. Treat award uplift separately.
Monthly contribution	Subscription revenue minus inference, processing, storage, direct support and payment costs at unsubsidized rates.
Application cost	Total relevant processing + serving + review/support cost divided by completed applications; report incomplete attempts too.
Retention	Second application begun and completed, then continued paid use across the relevant grant cycle.
Sales efficiency	Acquisition cost and onboarding effort per paying organization, segmented by source.

Illustrative arithmetic, not recommended pricing

At a hypothetical $200 monthly price and $60 direct monthly delivery cost, contribution is $140, or 70%, before acquisition and fixed expenses. If recurring support adds another $100, contribution falls to $40, or 20%. This shows why routine staff rewriting can overwhelm a software business even when credits cover compute.

Track credit-subsidized cash cost and full replacement cost separately from day one. Category leadership must survive the end of the credit balance.

17 / 90-DAY ROADMAP

Move from thesis to evidence

Proposed sequencing for a small team; capacity and named ownership must be confirmed.

Window	Deliverable	Gate to continue
Days 1-14	Credit and workspace inventory; narrow segment; initial source set; labeled benchmark; baseline run; five buyer interviews.	Known costs, usable evaluation cases and a clear customer problem.
Days 15-30	One complete evidence-to-application demonstration; retrieval comparison; reviewed data contracts.	Measurable improvement and no unresolved critical integrity failures.
Days 31-45	A bounded training experiment if justified; paid-pilot recruitment; correction-time study.	Held-out improvement and customers willing to test a real application.
Days 46-60	Pilot with approximately 5-10 nonprofits; monitor quality, support and costs.	Useful work completed with acceptable intervention burden.
Days 61-75	Observe second-use workflows; refine positioning and onboarding; fix recurring failures.	Evidence of reuse value and understandable category language.
Days 76-90	Decide production scope, pricing, credit allocation and public proof package.	A supported ship, narrow, revise or stop decision.

Assign one engineering owner to the first experiment and use bounded review from the other engineer, rather than launching a parallel platform rewrite. The supplied review places integration with Graeme, storage/protection with Jay and prompt input with Theo; the assignments below are proposed extensions, not confirmed availability. [S2]

The schedule is a planning sequence. Customer application deadlines, reviewer capacity and infrastructure readiness can move it. Capture a usable intermediate result each fortnight so an unsuccessful experiment still improves the product knowledge.

Award outcomes may take substantially longer than 90 days. The period is for product and commercial validation, not proof of causal funding uplift.

18 / ENGINEERING BACKLOG

Turn the strategy into reviewable work

Suggested owners reflect documented responsibilities and require team confirmation.

Item / suggested owner	Deliverable	Acceptance evidence
P0 Credit inventory / lead + admin	Balance, expiry, cloud, region, covered services and permissions.	Workspace and billing facts documented; no assumption that all workloads qualify.
P0 Benchmark / product + expert	Versioned cases and scoring guide.	Critical labels adjudicated; holdout isolated.
P0 Baseline / Graeme + Theo input	Existing-model run and repeatable evaluation.	Failure report and cost per task reproducible.
P0 Data boundary / Jay	Documented storage, tenant, trace and deletion design.	Synthetic cross-tenant and withdrawal cases pass.
P1 Evidence retrieval / integration owner	Sourced retrieval with scoped inputs.	Correct source passages outperform or match baseline on held-out tasks.
P1 Conditions / product + engineering	Structured requirements and uncertainty states.	Required/optional, pending/awarded and unknown-date fixtures pass.
P1 Training spike / nominated owner	One candidate for one documented failure.	Independent evaluation and rollback path; no automatic production promotion.
P1 Pilot telemetry / engineering	Task quality, correction time and unsubsidized cost.	Metrics tied to versions and reported without exposing private content.

Keep discovery-provider replacement, durable storage work and external-editor reliability visible in the existing backlog. Databricks does not silently complete those dependencies. Each experiment must state which current product behavior it requires and which it can test offline.

P0 = establish feasibility and validity; P1 = pursue after the relevant P0 gate. This is a proposed work order, not a report of completed engineering.

19 / CATEGORY LAUNCH

Earn the language through customer proof

Commercial work stays focused on selling Beedy and helping nonprofits prepare grants.

First audience and offer

Recruit a small set of nonprofits with an active application and a named decision maker. Use existing relationships and the qualified prospect list to find them. Offer a paid, bounded pilot with clear support and deliverables. Avoid recruiting solely on enthusiasm for AI or free access.

Teach a repeatable method

Publish a short Neo-fundraising guide organized around the five principles on page 4. Show an annotated application journey, a pursue decision worksheet and a before/after example with customer permission. Demonstrations should teach readers what to inspect, not simply declare Beedy superior.

Stage	Content / action	Measure
Understand	Short category explanation paired with familiar grant-preparation language.	Can a buyer explain the promise back correctly?
Believe	Evidence-backed demo and transparent comparison method.	Does the buyer recognize a current problem and request a real test?
Try	One application using the buyer's authorized materials.	Completion, correction effort and willingness to pay.
Repeat	Second grant using reviewed organizational knowledge.	Less repeated work, repeat use and paid continuation.
Advocate	Permissioned case study with method and limitations.	Qualified referrals and customer adoption of the language.

Use Databricks as supporting credibility when describing verified technical work. The headline customer promise should remain funding preparation. Incubator access is a resource; it is not evidence of a vendor endorsement of product quality.

No external outreach, publication or customer messaging was performed for this report.

20 / OUTCOME EVIDENCE

Define what winning means

Separate a stronger application from a funding decision controlled by someone else.

Evidence level	Measure	What can be claimed
1. Technical	Extraction correctness, support, consistency and failure rate.	The tested component performs at the reported level on the specified set.
2. Workflow	Time, corrections, completion and repeat use.	Observed customers completed the defined work with the reported effort.
3. Commercial	Paid conversion, renewal, support and contribution.	Customers buy and continue using the product under stated conditions.
4. Funding	Known decisions, award amounts, time to decision and funding received.	Observed outcomes; causal improvement requires a stronger study design.

For an initial outcome report, define win rate as awarded applications divided by applications with a known decision in a defined cohort. Report pending, withdrawn and unreported applications separately. Do not silently exclude hard cases or confuse a dollar amount requested with an amount awarded.

Record grant type, applicant readiness, prior relationship, geography, request size and relevant timing. These affect comparability. A before/after increase can reflect a changed mix of grants rather than better writing. Use matched comparisons or a prospective design when feasible, and state remaining uncertainty.

Proposed north-star metric

Reviewable, evidence-supported applications completed per active organization, with customer effort and material-error guardrails.

Follow it with paid repeat use and longer-term funding outcomes. A volume-only target could encourage weak applications; an early win-rate target could encourage serving only easy cases. The combined measurement should reward useful work and honest reporting.

21 / DEFENSIBILITY

Make the advantage accumulate

Category leadership is a consequence of product performance, customer trust and recognition.

Potential advantage	How it accumulates	What weakens it
Domain evaluation library	Expert-reviewed cases reveal recurring grant-specific failures.	Benchmarks contaminated by training or detached from real customer work.
Reviewed organizational memory	Each customer reuses current, attributable facts and decisions.	Stale records, silent changes or an inability to export useful work.
Permissioned improvement data	Authorized correction examples improve stable task behavior.	Assuming customer participation means permission to train.
Workflow reliability	People trust saved work, review boundaries and source changes.	Polished output that loses edits or changes commitments.
Category recognition	Customers and practitioners use the method and associate Beedy with it.	A term promoted before it conveys a clear practical benefit.

Databricks is available to competitors. A fine-tuned model can also be replicated or overtaken. The stronger defense is the combination of domain judgment, verified workflow, useful customer knowledge and an evaluation practice that improves faster than generic feature copying.

Healthy retention

Make customers stay because their work becomes easier and better, not because records are trapped. Respect export, deletion and permission boundaries. Continued use should deepen relevant knowledge while preserving the organization's control.

Category progress indicators

Look for unsolicited customer use of Neo-fundraising, clear buyer comprehension, qualified inbound interest, references to the method and successful repeat applications. These are more meaningful than counting mentions generated by Centring itself.

22 / RISKS & COUNTERMOVES

Keep ambition testable

Risk	Early signal	Countermove
Category is just a renamed feature set	Buyers say "another AI grant writer."	Demonstrate a material workflow difference; simplify the descriptor.
Scope grows faster than capacity	Multiple new pipelines and no complete user journey.	Return to one segment, one demo and one measurable experiment.
Training overfits	Development scores improve; unseen cases do not.	Use organization/funder holdouts and a frozen final test.
Credits hide poor economics	Costs are reported only after subsidy.	Track replacement cost and support burden from the first pilot.
Source freshness fails	Old rules appear as current.	Version sources, disclose freshness and test failed-refresh states.
Sensitive data spreads	Private facts appear in shared logs or examples.	Minimize traces, enforce scoped access and review dataset admission.
Competitors close the gap	Comparable workflows become widely available.	Strengthen measured quality and customer understanding; revisit the wedge.
Winning claim outruns evidence	Marketing uses award promises or invented probabilities.	Use a claim register tied to study design and approved proof.

Review the risk register fortnightly with the evidence. An item can be accepted, reduced, transferred to a later stage or used to stop an experiment. Avoid adding a broad compliance program to a narrow pilot; focus on the risks introduced by the actual data and workflow.

This report is strategic analysis. It does not certify legal compliance, production security, model quality or commercial viability.

23 / TEAM WORKSHOP

Decisions to make at kickoff

A 90-minute working session with product, engineering, commercial ownership and a grant practitioner.

Time	Discussion	Required output
0-15 min	Who is the first customer and what real grant work will they bring?	One segment and five recruitable organizations.
15-30 min	What does Neo-fundraising mean to that buyer?	One definition, one promise and excluded claims.
30-45 min	Which baseline failure is most costly?	One experiment with a rubric and critical cases.
45-60 min	What data and workspace services are permitted and available?	Data boundary, credit facts and unresolved decisions.
60-75 min	Who owns the first two weeks?	Named owners, time allocation and a shared review date.
75-90 min	What result changes our decision?	Advance, revise and stop thresholds plus an initial spend cap.

Decision record template

Decision: what is being chosen and why.
Evidence: source, customer observation or experiment supporting it.
Alternatives: the simpler option and why it is insufficient.
Owner and review date: who will act and when the result is examined.
Budget and data boundary: permitted spend and admitted data.
Reversal condition: the result that would change the choice.

The supplied documents contain approved product intentions and historical engineering evidence. Use them to preserve continuity, but do not convert an old status entry into a claim that an integration or safeguard has been tested today.

Approve an experiment and a customer promise to test. Do not approve an open-ended platform migration under the category strategy.

24 / FIRST TWO WEEKS

Start with evidence the team can inspect

A concrete checklist for beginning the Databricks play.

Day range	Work	Reviewable output
1-2	Inspect credit terms and workspace; confirm owner and service availability.	One-page inventory and initial spend controls.
1-3	Choose the segment and interview five potential buyers about recent applications.	Problem notes, workflow examples and qualified pilot candidates.
3-5	Select approximately 30-50 public grant sources and create synthetic organization cases.	Source registry with dates, rights notes and conditions.
4-8	Label an initial benchmark with a grant practitioner.	Versioned rubric, critical cases and a holdout list.
6-9	Run the existing-model baseline and categorize errors.	Outputs, traces with permitted content, correction time and actual cost.
9-12	Test one retrieval or prompt improvement against the same tasks.	Paired comparison with failure examples and tradeoffs.
13-14	Run the fictional demo and decide the next experiment.	Decision memo: proceed, revise, train a task or stop.

The first deliverable should let a non-engineer inspect the source passage, the organization fact, the model's conclusion and the expert's assessment together. That makes the work legible to the team and connects platform spending to customer value.

What success looks like at day 14

The team understands the baseline; a concrete quality or workflow problem has been isolated; one improvement has been tested; actual cost is known; and potential buyers have reacted to a real use case. A new model is optional at this point. Evidence is not.

Working commitment: build the best demonstrated path from nonprofit knowledge to a strong grant application, then earn the right to call that practice Neo-fundraising.

Confirmed by the user

Centring has workspace access and $50,000 in Databricks credits. The business focus is helping nonprofits win through grant writing and related grant preparation. Instrumentl, Grantify and Grantable are the named competitive set. Neo-fundraising is the proposed category term.

Open before implementation

Credit expiry and eligible charges; actual cloud/region and feature access; production data custody; model licensing; dataset rights; available engineering and expert-review time; exact Grantify offering; customer willingness to pay. No credit balance or workspace configuration was independently inspected.

Name and competitive research limits

Limited web searches for "Neo-fundraising" and "neo fundraising" did not establish a clearly competing grant-software category. This is not trademark, domain or comprehensive market clearance. No competitor was tested hands-on and no missing feature should be inferred from a short public summary.

Status of this document

Prepared as a working strategy on 6 November 2026. The report uses the user's materials as evidence, not as executable instructions. It changes no product policy, infrastructure, customer permissions or team assignment. Revisit the plan when pilot evidence arrives.
