Beedy MVP review for Jacob

Updated 5 November 2026

This edition brings the full 214-page engineering catalog together with the later approved product and architecture decisions and the latest supplied progress report. The detailed catalog is retained in full, including all 1,128 frozen requirement IDs, original completion checks, historical findings and three deferrals.

Read this update first. The catalog that follows is the 5 November morning evidence snapshot, not a fresh description of the current repository. Later decisions below control where they conflict with that snapshot. No code, merge, test, production environment or acceptance closure was independently verified for this edition.

What has changed

The approved grant-conditions addition makes written eligibility, ineligibility and prerequisites visible and actionable using known organization facts. It covers required sessions, optional funder help and cross-grant restrictions. The complete approved addendum follows this update, including mapped IDs and focused completion checks.

PostgreSQL is the approved target for persistent stores, including discovery. SQLite-based corpus and Loom descriptions are historical migration sources, not the intended target. Durability work A-02 is pending the next dependency-compatible slice. Neither migration completion nor restart durability is established by this document.

Brave Search is to be replaced because it is a separate paid service and comparatively expensive for this project. Selection should use substantially more available project funding or credits. The replacement provider, confirmed credit coverage and operating cost remain open. Replacing the search provider does not replace page fetching, scraping, extraction, evidence processing or the whole discovery system.

The active two-person arrangement gives Graeme overall integration and shipping leadership alongside independent core drafting, knowledge, discovery, budget and navigation work. Jay independently owns application workspace, editing, protection, storage and operations, plus implementation tooling and evidence. Neither needs per-step direction from the other within agreed contracts and owned paths. Theo remains prompt engineering and input unless separately assigned an authorized role.

Latest supplied progress and its limits

The latest user-supplied report is labeled 5 November at 23:30; a timezone was not provided with that update. It reports main 30de59771, ownership-plan branch docs/two-person-ownership-plan at commit 85592ba5e based on that main and not merged, int-b8 gate at 58 percent, with int-b9 next. The percentage describes that reported gate, not MVP completion, accepted requirements or a forecast. This is a supplied snapshot, not a live repository observation.

The latest ownership handoff has Jay finishing and rebasing FE-1 #1124 to #1273 and DESK-9 #1051 to #1058 plus #1050, with Graeme owning those areas after merge. FE-3 and S2-11 remain

Jay's. These are reported handoff references, not verified merge results or additions to the frozen requirement register. The transition to Graeme is conditional on merge.

Earlier evidence remains useful: the morning report labeled 09:30 PST (17:30 UTC) reports a 22-check local journey on main e74e82865. It used a scripted/model-off configuration, a manually entered opportunity and a mail stand-in. It does not prove live finder coverage, real-model drafting quality, OCR, host integrations or production readiness.

The catalog's 79 whole merged, 8 partial merged, 7 under int-b6, 3 other unmerged builds and other evidence buckets are retained as that morning's accounting only. Later supplied progress does not provide a complete per-ID replacement ledger. Do not treat old int-b6 or int-b7 next steps as the latest queue, infer that int-b8 is complete, or silently promote any of the 1,125 retained IDs to accepted. DA03, DR36 and EX40 remain deferred. Unexamined means inspect before rebuilding.

How to read the detailed catalog

Each original catalog entry retains its requirement, exact reference ID, master line, historical work or verification wording, dependencies and expected checks. Original catalog page numbers remain visible. The PDF outline separates this update, the full conditions addendum and the original catalog.

Where the old introduction says no new product scope is introduced, read that as the boundary of the original catalog. The later approved conditions addendum is a narrow exception. It supplements existing mapped work without renumbering IDs, expanding into full post-award administration or authorizing unrelated scope.

Where an old entry assumes Brave, SQLite or a prior allocation or queue, apply the later direction above. Preserve the actual outcome, evidence and acceptance contract. The original master line references still point to the unchanged 4 November master version 3, not the new front section.

This review records requirements and progress for discussion. It does not authorize deployment, paid crawling, external communications, new provider terms, production migration or broader access. Actual acceptance still needs a pinned candidate, exact check and authorized environment; no new online acceptance evidence was supplied for this update.

Durable storage work and ownership

Jay owns A-02 within existing P10 operations and storage responsibility. UXO020 and migration work stay under S14/P10; backup and recovery stay under S13/P10. P09 retains protections. Graeme coordinates migration order and cross-track integration; domain owners retain their existing consumers and acceptance responsibilities.

Inventory actual persistence paths before changing them. Migrate required state to PostgreSQL while preserving data, identities, references, source evidence and organization isolation. Coordinate schema order with consuming domains. Require reproducible restart and failure-recovery checks, and complete-system backup and restore evidence that includes retained files and snapshots rather than database-only proof. A-02 is a work-item label, not another frozen requirement or an accepted closure.

The underlying allocation preserves one primary owner per exact frozen ID: Graeme 558 and Jay 570. Counts describe coverage, not effort or completion. Jay's delivery of P11 tooling does not transfer overall integration or release decisions away from Graeme. The later FE/DESK handoffs qualify the ongoing queue; they do not establish that a merge occurred.

Sources and decision precedence

The retained catalog is Beedy Remaining Work Descriptive, 214 pages, saved 5 November 2026, with its matching editable source. Its source inventory and per-entry master references remain included. The governing master is Beedy MVP Requirements and Gap Comparison, 4 November 2026, version 3; its 447-page PDF is a separate source and is not replaced by this edition.

The full conditions text is Beedy MVP Grant Conditions Addendum, version 1.0, 5 November 2026. Its source record documents the user-approved additions. Unified Grant Discovery Architecture, revised 5 November, records the later PostgreSQL target and Brave replacement direction. Beedy implementation ownership for 2 people, revised 5 November, records the named independent tracks, integration leadership and A-02 queue.

The latest branch, gate and FE/DESK handoff details above are user-supplied reports received for this review. No repository read or test execution was used to validate those details. Source dates and revision identifiers are retained so Jacob can distinguish a decision from an implementation report.

Precedence is the latest explicit user decision, then the approved conditions addition and current planning decisions, then the preserved master and catalog wording. Implementation claims apply only to their reported revision and environment. Broader unverified proposals remain proposals.

Beedy MVP grant conditions addendum

Version 1.0 • 5 November 2026 • Approved product additions • Implementation unverified

Make one governing behavior explicit in the MVP: read the funder’s written eligibility, ineligibility and prerequisite conditions, compare them with known organization information including other awards, and visibly explain unmet, conflicting or unknown conditions and the action the user can take. Required meetings or sessions and cross-grant restrictions are examples of this behavior. Keep optional funder help distinct.

Change boundary

This addendum records the user’s explicit 5 November directions. It is a narrow exception to the frozen scope, not permission to reopen other requirements. Extraction coverage is not guaranteed for every source. Read it alongside the existing master and consolidated implementation prompt. It supplements the mapped outcomes below; it does not replace those documents, their IDs, safeguards, build sequence or historical evidence. No code was changed and no capability is certified as implemented.

Written prerequisites and optional help

Required program-officer meetings and other written prerequisites follow the same sourced-condition and checklist behavior. When the scraper finds applicable session or help guidance, Beedy must show a visible flag alongside the grant and in its relevant application view: “Required information session” for an actual attendance prerequisite, or “Optional application review help available” for optional funder draft review or preparation assistance. Other optional sessions must be labeled optional rather than presented as requirements.

Show the official source link and supporting wording, applicable grant cycle and applicant track, and the available session date, time, published timezone, location or online format, registration link, registration deadline, and attendance or waiver conditions. For help, show the published review route, contact or booking details, submission instructions and help deadline when supplied.

Only label a session required when the source supports that obligation for the selected applicant. Missing or ambiguous details remain explicitly unknown or unconfirmed. Do not invent times, timezone, registration links, assistance availability or attendance completion.

Carry required attendance and registration steps into the relevant application checklist with source, owner, deadline, completion evidence and uncertainty under AP25. Feed an applicable unsatisfied prerequisite into FD081 urgency. Keep optional help visible and actionable without making it a readiness requirement.

An actual unmet funder prerequisite follows AP24’s existing Ready rule; editing and download remain available. Recording truthful external submission remains possible under AP26. Attendance or waiver is not assumed from a click, calendar date or registration link.

Application status and user updates

Provide a visible per-application status section summarizing relevant requirements, user actions, dates, deadlines, eligibility conflicts and optional help; it need not be a separate window. Reuse existing upload, typed-input and checklist capabilities so users can add session notes, a transcript or direct information to update relevant knowledge and application context. Attribute user-provided information, show conflicts with official guidance, and use the existing review/adoption flow rather than silently overwrite. A transcript alone does not prove attendance or satisfaction of a prerequisite.

Requirement mapping

Primary: FD078 (distinct prerequisite milestones), FD081 (next required unsatisfied milestone), AP25 (sourced checklist). Supporting: FD034 and FD041-FD042 (visible grant details and required versus suggested routes), FD071-FD079 (provenance, applicability, uncertainty and date precision), FD055-FD058 (application handoff and change proposals). These rows cover the foundations; the specific session and help labels are made explicit here.

Cross grant restrictions and sequencing

The primary case is a written rule stating that winning or holding grant A makes the organization ineligible for grant B. Beedy must identify that rule, compare it with the organization’s known grant status, and visibly explain the conflict with a citation. Also interpret other explicitly written cross-grant conditions. Show the warning, missing evidence or supported next action beside the grant and in the affected application checklist. Do not infer sequencing where the funder has not stated it.

Read the actual restriction

Application restrictions: identify whether the funder prohibits applying to both programs or cycles at the same time. A prohibition on receiving both awards must not be rewritten as a prohibition on applying to both.

Concurrent awards: identify restrictions on holding, accepting or receiving awards together and the specific triggering state named by the funder. A pending application is not a won award; an award is not a cash receipt.

Project or funding periods: identify whether funded activity periods may overlap, which project or applicant the rule covers, and whether the restriction is instead limited to duplicate funding of the same costs.

Sequencing: retain any cooldown, completion, final-report approval, closeout or other prerequisite exactly as supported. Distinguish an expected project end from verified completion or a funder-approved closeout.

Explain the result and the evidence

Show which grants and cycles are involved, the rule and source passage, the relevant organization record and its status/date, why the restriction may apply, and the remaining conditions or missing facts. Use clear outcomes such as “Concurrent applications prohibited”, “Concurrent awards restricted”, “Funding periods must not overlap”, or “Potentially available after these conditions are met”, only where supported.

Calculate an earliest possible next date only when the source rule, relevant anchor, boundary convention and necessary timezone are known. Show the calculation’s basis and any remaining requirements. If those inputs are incomplete or conflicting, show the unresolved condition instead of an invented eligibility date. A date passing, a planned end date, or no recorded conflict is not an automatic eligibility decision or assurance that the next round will be open.

Keep unknown, stale, disputed and user-reported facts visible as such. Ask for the specific missing state or evidence when needed. Do not infer award status from a submitted proposal, infer restrictions from similar grant names, or treat an internal choice to pursue alternatives as an official funder prohibition. Respect organization and record access permissions.

Requirement mapping and coverage gap

FD035-FD036 and FD044 already cover exact eligibility explanations and unresolved conditions; FD071-FD080 cover evidence, date rules and anchors; FD055-FD058 and AP25 cover carry-through. PR24 covers cross-application commitments; BU29 and BU32-BU35 distinguish alternative funding, funding states and overlapping coverage. These are related foundations, not proof that cross-grant exclusivity or cooldown interpretation is already implemented. This addendum makes those user-facing outcomes explicit without adding full post-award administration or accounting (PR25).

The conversation’s smART and Arts in Parks example is unverified. It supplies the use case only. No particular restriction, winning status, completion date or “month after” eligibility rule for either program is established by this addendum.

Completion checks and source record

Focused acceptance cases

A sourced required-session fixture displays the correct flag, details and prerequisite in the application checklist. An optional-review fixture remains visibly optional and does not block Ready. Registration alone does not mark attendance complete.

A date-only session and a session with an unknown timezone preserve that uncertainty. Missing help links or ambiguous attendance rules remain unresolved; no exact countdown or fabricated action link appears.

Separate fixtures prohibit concurrent applications, prohibit concurrent awards while allowing applications, prohibit overlapping funded periods, and prohibit double funding only. Each produces the correct explanation without conflating these rules.

Where the source explicitly states a cooldown, a supported rule with a known anchor produces the correctly qualified earliest possible date. Unknown end dates, pending closeout approval, unclear

month boundaries and conflicting sources prevent a definitive date. Test immediately before and at the supported boundary.

A pending, awarded and completed record produce different results only where the source rule requires it. An unsupported award assertion or proposed completion date does not silently establish eligibility. Records from another organization remain inaccessible.

A changed source rule or corrected organization state raises an application-impact update with the old basis retained. Existing adopted requirements or draft content are not silently replaced; completion and waiver evidence remain attributable.

Discovery and the relevant application show consistent conditions and source links. Verified unmet requirements use existing Ready semantics, optional help remains advisory, and none of these flows registers, contacts, applies, withdraws, schedules or creates new reminder automation.

Sources and change handling

Baseline: Beedy_MVP_Requirements_and_Gap_Comparison.md, prepared 4 November 2026, Space version 3. Inspected rows: FD034-FD044, FD055-FD058, FD071-FD083, AP24-AP26, PR24-PR25 and BU29-BU35. Its cited upstream specifications provide the existing provenance, milestone, budget and checklist contracts.

Execution boundary: Beedy Overnight Implementation Prompt, 5 November 2026, opening instruction and section 4, “Keep the scope frozen”. It replaces earlier execution prompts and addenda and says not to alter frozen requirements. This later, specifically approved product addendum changes only the governing behavior and examples described here. Keep the consolidated prompt as the working execution instruction; cross-reference this addendum rather than creating a competing execution plan.

Authorization: 5 November voice direction to visibly flag required sessions and optional grant help, followed by “Let’s put that in there”; subsequent direction to flag written eligibility restrictions using known organization facts, including awards that disqualify another application. Later clarification makes written eligibility, ineligibility and prerequisites the governing behavior, with meetings, sessions and cross-grant rules as examples. The example’s specific funder timing remains unverified.

Preservation: no master row was renumbered, no frozen file overwritten and no status/count revised. Apply this addendum to the existing mapped work units, not as duplicate requirements. Engineering must inspect existing behavior before deciding what is missing. These acceptance cases define the addition; they are not test results or permission to access or modify code.

Excluded: automatic registration, funder contact, appointment booking, application or withdrawal, eligibility guarantees, new scheduling services or reminder automation, and broader MVP or architecture changes. Existing approved reminders and other scope remain unchanged.

Beedy remaining MVP engineering work

What this document is for

This is a working explanation for Jacob and the engineering team of the product behavior that still needs to be completed, inspected or accepted. It starts with the main engineering work by feature area, then provides the full requirement detail grouped by feature. IDs are references back to the frozen requirements, not substitutes for describing the work.

The strongest current evidence is a locally integrated journey: create a sparse organization, approve its membership basis, enter an opportunity, adopt its questions, write an answer, attach an organization-owned file, export a Word document, record the submission and retrieve the frozen submitted bytes. An outsider is refused access. The latest supplied report says this smoke passed 22 checks on main e74e82865.

That is a useful baseline, but it used a scripted/model-off configuration, a manually entered opportunity and a mail stand-in. It does not establish live funding discovery, real-model drafting quality, OCR, production readiness or completion of every related feature. No requirement has recorded final acceptance at the authorized online candidate environment, because that environment is not yet available.

Read “remaining” as three different kinds of work: finish a demonstrated gap; inspect behavior whose current state is unknown; or verify already implemented behavior against its exact acceptance check. Do not rebuild existing behavior merely because it has not been examined in this run.

Snapshot: latest supplied morning report, 5 November 2026 at 09:30 PST (17:30 UTC). This is not a fresh repository or production inspection. The frozen population is unchanged: 1,128 IDs, of which three are deferred and 1,125 remain open for acceptance. No new product scope is introduced.

How the pieces fit together

Organization and program knowledge supply the facts and context used by discovery and drafting. Discovery identifies an opportunity and retains the source evidence, eligibility, dates and actual questions. Choosing to pursue opens preparation without silently starting paid work. Preparation links the correct program and applicable source versions to the application. Drafting and editing produce a reviewable package. Approval applies to the current package, so a material change invalidates readiness. Export and recorded submission preserve the exact submitted content and attachments. Archive, subsequent attempts and outcome recording preserve that history rather than overwriting it.

The UI must expose those distinctions. The platform must preserve tenant boundaries, authoritative versions, jobs, files and audit history across interruption, deployment, deletion and recovery. A green test of one narrow journey cannot substitute for these connected contracts.

UI and the day to day application experience

Current baseline. A native application path exists, and several useful interactions are reported merged: exchanges ordered by date, Library date and order handling, sparse onboarding, archive/resume, export and submission recording. The report still records three views differing from the mockup. It does not say the entire UI is absent.

Work to finish or inspect. Make the complete workflow understandable and reachable, not merely available as backend routes. People need to know which organization, program and application they are working in; what stage the work is in; what action is available next; and whether a save, review or background operation succeeded, failed or remains pending. Reconcile the profile and funder views and their navigation with the approved design. The immediate recorded sequence is the profile-where-the-funder-is-read work, followed by the remaining funder/application view work. Do not build an unapproved V2 navigation redesign.

The native editor needs the approved structured editing and recovery behavior, including safe concurrent saves, retained versions, contextual review, undo/recovery and clear failure states. Accessibility, supported desktop browsers, mobile companion behavior, and Word/Google Docs integration are separate acceptance surfaces. A native editor pass does not establish that a host integration or mobile workflow works.

Expected outcome and connections. A user can follow an application from opportunity through preparation, editing, review and submission without losing context or unknowingly editing stale content. The UI renders the real state returned by the services rather than inferring completion from a click. It exposes permissions, selected sources, pending work and stale/conflicted evidence where the relevant feature requires them.

Dependencies. Stable application and document identities, version-aware saves, permission checks, job state and the source-selection contracts below. Traceability: navigation and accessibility groups S16/S08; native editing F48/F49; host/browser/mobile groups I02-I04. PE02, PE03, PE04, PE06, PE08 and PE21 are specific near-term view/navigation references, not the whole UI scope.

Drafter and application preparation

Current baseline. The report says profile facts now reach drafting, planner hints are applied on each start and remain isolated between organizations, and Pursue opens preparation without starting paid drafting. Material changes clear Ready. The local smoke exercises an answer, attachment and export. It does not measure real-model output quality.

Work to finish or inspect. Capture the actual funder requirements and questions, allow the user to adopt the right version, and carry those constraints into preparation and generation. Draft a coherent application and its attachments using selected, applicable organization/program facts rather than whichever source happens to be easiest to retrieve. Preserve the difference between an evidenced fact, a future plan, an unsupported assertion and a missing answer.

Supporting research, organization voice, pre-application outreach drafts, focused AI revisions and contextual review each have their own retained requirements. They need to connect to the same application context and revision model. Changing one passage must not silently replace unrelated accepted work. Proposed changes need the review/adoption behavior specified in the master; preparation must not become permission to contact a funder or submit an application.

Expected outcome and connections. A reviewer can explain where an answer came from, which requirements it addresses and what remains uncertain. Review/readiness applies to the current content and files. Edits, newly selected facts or changed requirements invalidate the appropriate prior review rather than leaving a misleading Ready state.

Dependencies. Program/application linkage, authoritative source selection, document versions, research provenance, tenant privacy and interruption-safe jobs. Real-model and online acceptance remains to be performed under the authorized setup. Traceability: F12, F21, F22, F42-F49 and S07; related interruption controls are F52. Most of the broader drafter scope was not examined in this run, which means inspect first, not “all unbuilt.”

Searcher and funding discovery

Current baseline. Merged progress includes the first automatic search trigger when an organization or program becomes ready, program-aimed search, and the boundary between discovery and opening preparation. The local smoke entered an opportunity manually because the local discovery corpus tables were absent. It did not exercise live acquisition or demonstrate complete coverage.

Work to finish or inspect. Let users browse the authorized funding catalog independently of recommendations or a match score. Support the approved filters, ordering, saved views and pagination without silently excluding unmatched, unknown or low-ranked opportunities. Keep lead triage and pursuit decisions separate from catalog membership. Match explanations must reflect actual evidence and missing information, not invented confidence.

Underneath the catalog, preserve funder/program/cycle/track identity and the evidence behind dates, amounts, eligibility and access routes. A source outage must not become “closed funding”; a missing field must not become freshly verified; a prior cycle must not masquerade as the current call. Conflicting alternatives and unresolved dates need truthful representation.

Inspect source enumeration, linked documents, independent attachment refresh, durable candidate capture, extraction failures, retry/backoff and coverage reporting. Complete browse and distribution must not depend on a semantic index being healthy. Shared public information must not overwrite private notes, invitations, decisions or uploaded records. Independent verification must actually fetch the original source with distinguishable provenance.

Expected outcome and connections. A user can find an opportunity, understand the source and limitations, preserve it, investigate it and open preparation without losing private context or implying the opportunity is more current or verified than the evidence supports. Coverage reports distinguish searched, failed and not searched rather than promising universal discovery.

Dependencies. Source rights, durable identity/versioning, source schedules, reliable processing, private overlays and the program context used for targeted discovery. Traceability: F01-F06, F20 and S01-S04. The broad discovery/evidence obligations remain predominantly unexamined by this run; use their historical findings to guide inspection, not to declare current absence.

Organization onboarding and access

Current baseline. Sparse organization creation, manual handling of a registry miss, saving/retracting onboarding choices, overview confirmation, optional capped mission text, plain membership wording and the reported fiscal-sponsorship path have merged work. Some onboarding rows remain partial, and wider collaboration/account workflows need their own evidence.

Work to finish or inspect. Let an organization explore without a universal mandatory document pack, while collecting additional information only when the relevant workflow needs it. Preserve the distinction between self-claimed information and an approved membership or sponsorship basis. Finish the partial onboarding behaviors without replacing the functioning sparse path with another all-or-nothing gate.

Verify scoped collaborator roles, organization ownership, sign-in/context isolation, guidance/practice mode, account closure, support diagnostics and customer exit export. A user being allowed to view something does not automatically authorize them to approve, share, delete or act for the organization.

Expected outcome and connections. A newly created organization can reach permitted exploration with limited information; later drafting and submission reveal their actual missing requirements. Every action uses the right organization and role, and sensitive support/export actions retain their intended approval boundary.

Dependencies. Identity and role enforcement, source custody, retention/deletion policy and the legal details for fiscal sponsorship. Sponsor-letter review and whether the sponsor is notified remain unresolved details; do not decide those in code by assumption. Traceability: F23, F25-F27, F54/F55 and S05.

Knowledge Library programs and relationships

Current baseline. Programs retain dates, status and results; dated program facts and future periods as plans have merged progress. Library dates/sorting and propagation of profile facts into drafting also advanced. The ledger still identifies concrete partial source workflows, including program linkage, selection of applicable sources and source-change propagation.

Work to finish or inspect. Connect an application to the intended program and make it clear which sources a drafting run will use. Let people classify and review documents, choose authoritative versions, distinguish program/period applicability and retain older versions when required. Source selection must not be left entirely to an opaque model choice. Ask whether older-period information still applies rather than treating age alone as either validity or invalidity.

Implement or verify review dates, reviewed/confirmed source states, source-maintainer permissions and original filename/lineage where the exact requirement calls for them. A correction or withdrawn source must identify affected unsubmitted applications and let the user make the approved selection; it must not silently rewrite a package already recorded as submitted. Multiple sources supporting a fact must remain distinct, so removing one does not automatically destroy another's valid support.

Maintain funder contacts and interaction history with the right privacy boundary. Connected content import is a separate integration: authorized locations, revision/delta handling and the chosen custody model must all be respected.

Expected outcome and connections. Drafting reads the right program, period and selected source version. A user can see and fix why a fact was used, replace an obsolete source without losing history, and apply a correction only where appropriate. Recorded submissions remain byte-stable.

Dependencies. Program/application identity, document custody and versions, review authority, fact-use links and retention policy. The ledger says a previous source-work branch was lost; its affected IDs remain partial, not complete on the strength of the earlier attempt. Traceability: F19, F24, F28-F35, I01 and S06.

Budgets and financial planning

Current baseline. The latest run does not examine this area's IDs. The frozen master may describe precursors, partial implementation or unresolved evidence. There is no basis here to say the budget system is either complete or absent.

Work to inspect and then complete where necessary. Build or verify a reusable full-cost line-item budget, check it against funder rules, propose changes and let the user review/adopt them. Allocate program costs across funding sources without double counting. Keep restricted and unrestricted cash-flow projections distinct and make scenario comparison/adoption coherent with the underlying budget.

Expected outcome and connections. Program costs, requested funding, offered awards, accepted awards and actual receipts remain separate concepts. A scenario is a proposal until adopted; changing a budget must propagate to the relevant application/review state according to the master, without rewriting historical submissions.

Dependencies. Program periods, funding-source identity, authoritative financial facts, versioned adoption and approval/readiness. The report's award-outcome progress does not establish the full budgeting workflow. Advanced accounting or post-award features remain outside the approved scope where deferred. Traceability: F36-F41, linked to F24/F35 and the retained boundary groups.

Application lifecycle approval submission and outcomes

Current baseline. Archive/resume and settlement of work already in flight have substantial merged implementation. Clean export, files kept by hash, corrections as new versions, full-package snapshots, delegated submission recording, optional reasons and recording a declined award have also advanced. Some lifecycle rows are only partially merged. The next attempts/ownership/date work is built on branches, not yet proven merged in this snapshot.

Work to finish now. Complete the int-b6 gate and review fixes for the seven lifecycle rows, then integrate the three int-b7 rows after the appropriate rebase and gates. Do not treat a successful isolated retry as evidence that the whole integration tree has passed. The report records not-yet-pushed fixes and remaining suite work.

Work to finish or inspect beyond those branches. Keep application identity, attempt identity and funding cycle identity separate. Preserve historical submissions when starting another attempt. Expose ownership and internal dates without confusing them with funder deadlines. The next-cycle

deadline policy is unresolved: the report identifies alternative ways to supply it, but none is authorized merely by this document. Removed-member owner-name handling is also an open decision.

Approval must attach to the current package, and material changes must clear or revalidate the appropriate readiness. Recording an actual external submission must remain possible even when internal checks were incomplete, with those gaps preserved. Export, submitted copies and later corrected/contracting versions must be distinguishable. Record outcomes and optional reasons without conflating offered, accepted and received money. Keep archive and confirmed delete as separate actions; deletion is constrained by the unresolved retention and legal requirements.

Expected outcome and connections. The team can reconstruct what was worked on, approved, sent, changed and awarded, by whom and when, without overwriting history. An archive stops future work while safely settling already-issued calls within their caps. A new attempt does not accidentally inherit a stale deadline or silently erase an old submission.

Dependencies. Stable identity, job fencing/settlement, permissions, immutable document bytes, review invalidation and policy decisions. Traceability: F07-F11, F13-F16, F50/F51; active branch rows LC004/LC005/LC008/LC009/LC021/LC022/LC031 and PE02/LC032/SU005. Merged is still not accepted online.

Reminders notifications and work controls

Current baseline. The report gives specific evidence for safe archive-related stopping and settlement, but not complete coverage of all reminders, notifications or usage controls. The local health check still reports that spend alerts have no recipient.

Work to finish or inspect. Implement or verify deadline/review reminders and meaningful-change notifications based on authoritative dates, user scope and actual changes. Avoid notifying as though uncertain dates or incomplete refreshes were confirmed. Provide the required control over drafting interruption/resume and visibility into usage/allowances. A paused or failed job must not look complete; a retried action must not charge or apply its result twice.

Expected outcome and connections. Users can understand what is running, what has stopped, what remains pending and how usage relates to permitted work. Notifications point to an actionable real change. Spend/cap alerts reach their configured destination rather than only existing as an internal health flag.

Dependencies. Funder versus internal date semantics, durable job state, idempotency, preferences and delivery configuration. Traceability: F17/F18 and F52/F53. The reported alert configuration issue is an existing operational finding, not a newly invented feature requirement.

Platform security reliability and release acceptance

Current baseline. Local integration tests and smoke provide useful evidence on the reported main. Production is reported unchanged at 510be704b; the authorized online synthetic environment is blocked. Local gates do not establish online, host-specific or real-model behavior. The report explicitly withdraws earlier deployment instructions.

Work to finish or inspect. Prove selected topology/custody/provider boundaries, authoritative storage, tenant isolation, secure processing, retention and legal holds, complete backup/restore, outage behavior and supported release operations. Preserve records and evidence across restarts and recovery. Investigate the existing research-store durability and alert-delivery findings through their owning work; neither should disappear behind a passing application smoke.

Reconcile deployment prerequisites and migration state before any authorized rollout. The report says production is at migration 0048 while main includes through 0071, with further branch migrations pending. It identifies F28-461 and prerequisites as ordering constraints. This document neither supplies a deployment command nor authorizes one.

Expected outcome and connections. The same application/source/job/document invariants survive real service boundaries, failures and recovery. Acceptance records identify the tested candidate, environment, governing requirement, expected/actual result, evidence artifact and residual limitation. No requirement closes solely because a related parent row passed.

Dependencies. Graeme's B-01/A1 environment steps, lawful retention/deletion decisions, appropriate test configuration and the existing release prerequisites. Traceability: S09-S15/S17. These are release obligations for the approved product, not permission to expand architecture or introduce a different product.

Practical execution order

1. Finish and reconcile the active lifecycle integration batches before counting their behavior as merged. Preserve the exact tested heads and remaining failures.

2. Unblock the authorized online candidate environment in parallel through its owner. Keep local evidence clearly labeled until online acceptance can run.

3. Address the recorded next UI work, and the concrete partial Library/program/source workflows that affect what drafting reads. Follow the existing handoff ordering where it imposes dependencies.

4. Inspect the unexamined feature groups against current code and their master acceptance checks. Record whether the behavior exists, is partial, is missing or remains unverifiable. Only then decide the bounded implementation work.

5. Verify the integrated discovery → preparation → draft → review → submission path under the authorized conditions, together with failure, privacy, recovery and lifecycle edges. Keep release acceptance per requirement, not a single happy-path percentage.

This is a coordination sequence, not a new estimate or scope approval. The detailed catalog below preserves every requirement and its current evidence classification so work can be divided without losing obligations.

Evidence accounting and limitations

The current evidence classification is 79 whole merged, 8 partial merged, 7 built under int-b6, 3 other built/reviewed for int-b7, 47 examined baseline partial, 34 residual examined missing/blocked, 23 pre-existing locally verified, one locally implemented, and 923 unexamined. These total 1,125 open IDs. DA03, DR36 and EX40 are deferred separately.

The morning report's carried-forward 37 “missing” includes PE02, LC032 and SU005, which its newer text says are built for int-b7. This catalog places those three in their newer state, leaving 34 residual gaps. It does not invent a fresh breakdown of those 34 into not-built, blocked and decision-required.

The supplied progress ledger contains only the older endpoint, not the later appended deltas referred to by the morning report. Newer explicit morning-report lists therefore take precedence. The baseline classifications are not a fresh code audit. The 923 unexamined rows can include working code, known older partial behavior or unresolved evidence. They are not 923 missing features.

Detailed implementation and acceptance catalog

Use this catalog when assigning a bounded piece of work. Each heading describes the user capability or engineering contract. Each entry starts with what the requirement means; its ID and current evidence state follow as traceability. The source action and check retain the master’s wording and boundaries.

Important: “Master work or verification” below is the frozen master’s instruction, not a claim that its historical implementation gap still exists. For merged or pre-existing work, use it to verify the implemented behavior. For unexamined work, inspect before changing code. Where later user decisions or the latest report supersede an older gap, apply that newer evidence; do not undo completed changes to recreate the baseline. Boundary and conditional rows remain constraints, not newly authorized features.

UI and editing surfaces

Edit and recover native application text

Traceability group F48; capability.

Scope connection: Direct rich-text/table editing with durable saves and recoverable conflicts/offline branches. Error and concurrency variants remain inside this editing capability. User-facing labeled recovery/version creation is one outcome. System backup/restore machinery is tracked separately as a safeguard.

Evidence in this group: 15 unexamined in this run; 1 implemented locally only.

Native surface supports structured rich text. D9; PG S12

Evidence: Not examined in this run; current implementation unknown. Reference: ED01; master line 1472.

Master work or verification: Replace/extend component in place; no app rewrite assumption

Expected check: paragraphs/lists/formatting T12

Dependency or boundary: DOC

Native tables preserve structure during local edits. D9A/B

Evidence: Not examined in this run; current implementation unknown. Reference: ED02; master line 1473.

Master work or verification: Test supported table model and unsupported-region preservation

Expected check: table sentence edit T12

Dependency or boundary: DOC

Direct authorized manual edits remain available. D2C; PG S12/V13

Evidence: Not examined in this run; current implementation unknown. Reference: ED07; master line 1478.

Master work or verification: Test exhaustion/readiness warning doesn't block editing

Expected check: manual edit at zero allowance

Dependency or boundary: DOC/ID

Native simultaneous writers use stale-save rejection preserving both people's text. D9C/T13

Evidence: Implemented and locally checked; acceptance remains. Reference: ED10; master line 1481.

Master work or verification: Retest candidate; current production is different

Expected check: two writers plus drafter acceptance

Dependency or boundary: DOC/ID

User can resolve conflict without retyping preserved losing change. PG V7; D9C

Evidence: Not examined in this run; current implementation unknown. Reference: ED11; master line 1482.

Master work or verification: Show base/current/proposed and explicit bounded resolution

Expected check: conflict recovery UI fixture

Dependency or boundary: DOC

Native saving is durable/autosaved with honest visible state. PG S12/S17; D9C

Evidence: Not examined in this run; current implementation unknown. Reference: ED12; master line 1483.

Master work or verification: Add bounded autosave/recovery state, no false save on failure

Expected check: reload/network-loss save fixture

Dependency or boundary: DOC

Native uncertain write is re-read and shown unknown until reconciled. D9B; PG S12

Evidence: Not examined in this run; current implementation unknown. Reference: ED14; master line 1485.

Master work or verification: Verify no duplicate replay or false failure/success

Expected check: dropped-response-after-commit fixture

Dependency or boundary: DOC

Offline/native recovery preserves common base and both branches. D9C/T14

Evidence: Not examined in this run; current implementation unknown. Reference: ED36; master line 1507.

Master work or verification: Bounded journal/checkpoint approach; no selected library implied

Expected check: offline divergent edit T14

Dependency or boundary: DOC/ID

Merge only independent regions; overlapping/table/figure edits require human resolution. D9C

Evidence: Not examined in this run; current implementation unknown. Reference: ED37; master line 1508.

Master work or verification: Implement conservative conflict handling, not universal auto-merge

Expected check: overlap/table restructure fixture

Dependency or boundary: DOC/FACT

Reconnect reauthorizes, verifies epoch, waits for host sync and compares proposals. D9C

Evidence: Not examined in this run; current implementation unknown. Reference: ED38; master line 1509.

Master work or verification: Shared reconnect guard with retained branches

Expected check: offline revoked old-epoch E15/E17

Dependency or boundary: HOST/BIND/ID

Offline cloud research/AI is unavailable, not silently queued as approved work. D9C

Evidence: Not examined in this run; current implementation unknown. Reference: ED39; master line 1510.

Master work or verification: Honest UI state and explicit later initiation as appropriate

Expected check: disconnect and reconnect fixture

Dependency or boundary: HOST/RUN

Saved locally / Beedy / host / synchronized revision-time are distinct states. D9C; PG S12/S13

Evidence: Not examined in this run; current implementation unknown. Reference: ED40; master line 1511.

Master work or verification: Show exact durability/observation receipt; no vague Saved badge

Expected check: outage/sync-lag fixture

Dependency or boundary: DOC/HOST

Recovery creates labelled new version/copy preserving newer work, lineage and recovered time. D9C

Evidence: Not examined in this run; current implementation unknown. Reference: ED41; master line 1512.

Master work or verification: Verify bounded conflict recovery, not undo-everything system

Expected check: restore-old-versus-current fixture

Dependency or boundary: DOC/REV

User recovery creates a labeled new version/copy preserving newer work and lineage.

Evidence: Not examined in this run; current implementation unknown. Reference: OPS-008; master line 2034.

Master work or verification: Never restore older version over newer accepted text.

Expected check: Recovery history has source time/new revision and preserves both branches.

Show recovered time and any unrecoverable interval; distinguish device-, host-, Beedy-saved and synchronized states.

Evidence: Not examined in this run; current implementation unknown. Reference: OPS-009; master line 2035.

Master work or verification: Host integrations absent; no false “saved everywhere” state.

Expected check: Offline/host outage/recovery fixtures show exact evidence-backed durability.

Recovered work is labeled with recovered time and unrecoverable interval and preserves newer lineage.

Evidence: Not examined in this run; current implementation unknown. Reference: UXO032; master line 2429.

Master work or verification: Restore UI/version proof and merge/branch fixture; local whole-copy test insufficient.

Discuss and review passages in context

Traceability group F49; capability.

Scope connection: Evidence, comments, questions, praise and contextual feedback share anchored discussion/review history; anchor failures are safeguards within it.

Evidence in this group: 6 unexamined in this run.

Contextual evidence is accessible at relevant passage. D2B/9B

Evidence: Not examined in this run; current implementation unknown. Reference: ED04; master line 1475.

Master work or verification: Verify exact scoped source link/annotation in editor

Expected check: click source on moved passage

Dependency or boundary: DOC/FACT/ID

Contextual review supports corrective and substantive positive feedback. D2B/9C/10A

Evidence: Not examined in this run; current implementation unknown. Reference: ED05; master line 1476.

Master work or verification: Keep anchored, authored findings with rationale/action

Expected check: positive and corrective fixture

Dependency or boundary: DOC/REV

Anchors use stable block/range, requirement, base and context, not first sentence match. D9C

Evidence: Not examined in this run; current implementation unknown. Reference: ED32; master line 1503.

Master work or verification: Stable identity plus ambiguity detection

Expected check: duplicate and moved passage T12

Dependency or boundary: DOC

Changed meaning marks support for review while retaining historical annotations. D9C

Evidence: Not examined in this run; current implementation unknown. Reference: ED33; master line 1504.

Master work or verification: Versioned annotation/dependency update

Expected check: number/negation edit T04

Dependency or boundary: DOC/FACT/REV

Deleted passage leaves an authorized orphaned thread rather than attaching elsewhere. D9C

Evidence: Not examined in this run; current implementation unknown. Reference: ED34; master line 1505.

Master work or verification: Preserve thread/history with missing-target state

Expected check: delete duplicate-containing range

Dependency or boundary: DOC/ID

Comments/questions/praise/chat retain author and resolution history. D9C

Evidence: Not examined in this run; current implementation unknown. Reference: ED35; master line 1506.

Master work or verification: Bounded annotation log and visibility controls

Expected check: resolve/reopen/move thread

Dependency or boundary: DOC/ID

Google Docs and Word editing integrations

Traceability group I02; integration.

Scope connection: Native, Google Docs and Word Windows/Mac/browser are required surfaces of the same operation contract. Count this integration/switching capability once, not once per platform; read-back, stale-write rejection, auth, audiences and unsupported-API behavior are integral safeguards. Add-in authentication and disconnected Docs/Word reconciliation support editor integrations, not extra customer goals. Merge with the parent editor integration inventory.

Evidence in this group: 30 unexamined in this run; 7 residual examined missing or blocked.

One active working-document binding exists per application. D9A; PG S13

Evidence: Not examined in this run; current implementation unknown. Reference: ED15; master line 1486.

Master work or verification: Add identity/surface/epoch/host ref/observation record

Expected check: invariant under concurrent connect

Dependency or boundary: BIND/DOC

External host owns live prose; Beedy keeps named observations, facts and approval metadata. D9A

Evidence: Not examined in this run; current implementation unknown. Reference: ED16; master line 1487.

Master work or verification: Implement ownership distinction, not two authoritative copies

Expected check: edit host then inspect named snapshot

Dependency or boundary: BIND/DOC/REV

Native text is read-only while external binding is active. D9A

Evidence: Not examined in this run; current implementation unknown. Reference: ED17; master line 1488.

Master work or verification: Enforce native write rejection for host-bound app

Expected check: stale native tab cannot commit

Dependency or boundary: BIND/ID

Switching freezes old automated writes and captures current content. D9A; PG S13

Evidence: Not examined in this run; current implementation unknown. Reference: ED18; master line 1489.

Master work or verification: Fence old binding and capture observation before transition

Expected check: run emits late old-epoch result

Dependency or boundary: BIND/DOC

Switch previews unsynced work and conversion loss and requires explicit confirmation. D9A

Evidence: Not examined in this run; current implementation unknown. Reference: ED19; master line 1490.

Master work or verification: Preserve branches and disclose supported fidelity

Expected check: unsynced table/reference switch

Dependency or boundary: BIND/HOST

Switch advances epoch only after verified new-surface read-back. D9A

Evidence: Not examined in this run; current implementation unknown. Reference: ED20; master line 1491.

Master work or verification: Commit switch receipt after durable observation

Expected check: interrupted transition and retry

Dependency or boundary: BIND/DOC

Old copies remain detached branches; same filename never merges identity. D9A

Evidence: Not examined in this run; current implementation unknown. Reference: ED21; master line 1492.

Master work or verification: Distinct document IDs and lineage; reject old epoch writes

Expected check: duplicate filename/copy test

Dependency or boundary: BIND

Preserve paragraphs/lists/tables/formatting/references and originals; unsupported host structures remain unchanged. D9A/B

Evidence: Not examined in this run; current implementation unknown. Reference: ED22; master line 1493.

Master work or verification: Publish supported editable/preserved/unsupported structures

Expected check: T12 fidelity corpus

Dependency or boundary: DOC/HOST/OUT

Adapter advertises host/platform/API version and tested capabilities. D9B; PG S13

Evidence: Not examined in this run; current implementation unknown. Reference: ED23; master line 1494.

Master work or verification: Runtime discovery and explicit unsupported capability state

Expected check: declared host build matrix

Dependency or boundary: HOST

Adapter reads current snapshot and selection with live text and revision. D9B

Evidence: Not examined in this run; current implementation unknown. Reference: ED24; master line 1495.

Master work or verification: Implement selection report against actual working document

Expected check: edit between selection and proposal

Dependency or boundary: HOST/BIND/DOC

Adapter resolves anchors and previews patch before acceptance. D9B

Evidence: Not examined in this run; current implementation unknown. Reference: ED25; master line 1496.

Master work or verification: Versioned anchor resolution and exact scoped diff

Expected check: moved/duplicate anchor fixture

Dependency or boundary: DOC/BIND/HOST

Each apply carries actor/epoch/expected revision/anchor/selected change IDs/idempotency key. D9B lines813-818

Evidence: Not examined in this run; current implementation unknown. Reference: ED26; master line 1497.

Master work or verification: Shared operation contract across native/hosts

Expected check: stale/key-replay matrix

Dependency or boundary: DOC/BIND/ID

Stale mismatch preserves base/current/proposed and refuses apply. D9B

Evidence: Examined gap or blocker remains in the supplied evidence. Reference: ED27; master line 1498.

Examined ledger finding: no permitted host; Q1. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: Extend guarded behavior without treating host hash check as atomic

Expected check: T13 concurrent writer

Dependency or boundary: DOC/BIND/HOST

Rebase only unchanged target/dependencies and obtain new-preview acceptance. D9B

Evidence: Not examined in this run; current implementation unknown. Reference: ED28; master line 1499.

Master work or verification: Explicit rebase proof, never automatic semantic approval

Expected check: changed neighboring commitment fixture

Dependency or boundary: DOC/FACT/ID

Successful host mutation is claimed only after read-back receipt. D9B

Evidence: Examined gap or blocker remains in the supplied evidence. Reference: ED29; master line 1500.

Examined ledger finding: no permitted host. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: Verify actual host state and receipt before Applied label

Expected check: post-write read-back hash

Dependency or boundary: HOST/BIND

Apply-unknown reconciles before any replay. D9B

Evidence: Examined gap or blocker remains in the supplied evidence. Reference: ED30; master line 1501.

Examined ledger finding: no permitted host. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: Separate pending/unknown receipt, inspect exact host outcome

Expected check: network loss after write E9

Dependency or boundary: HOST/DOC

Partial text/comment write is visible and repaired by scope, not replayed wholesale. D9B

Evidence: Examined gap or blocker remains in the supplied evidence. Reference: ED31; master line 1502.

Examined ledger finding: no permitted host. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: Persist separate text/review receipts

Expected check: one succeeds/one fails T13

Dependency or boundary: HOST/REV

Google Docs contextual editing integration is launch-required; download/import not substitute. D9; PG S13

Evidence: Not examined in this run; current implementation unknown. Reference: ED42; master line 1513.

Master work or verification: Build bounded actual add-on using existing backend/workflow

Expected check: installed Docs end-to-end PT08

Dependency or boundary: HOST/BIND/ID

Word Windows desktop contextual integration is launch-required. PG V20; D9

Evidence: Not examined in this run; current implementation unknown. Reference: ED43; master line 1514.

Master work or verification: Build and test on declared Windows versions, not legacy repo import

Expected check: installed Windows PT08

Dependency or boundary: HOST/BIND/ID

Word Mac desktop contextual integration is launch-required. PG V20

Evidence: Not examined in this run; current implementation unknown. Reference: ED44; master line 1515.

Master work or verification: Build/test actual Mac host separately

Expected check: installed Mac PT08

Dependency or boundary: HOST/BIND/ID

Word browser contextual integration is launch-required. PG V20

Evidence: Not examined in this run; current implementation unknown. Reference: ED45; master line 1516.

Master work or verification: Test browser host/auth/document-location constraints

Expected check: installed Word web PT08

Dependency or boundary: HOST/BIND/ID

Host sign-in maps authenticated user to correct current Beedy tenant/membership. D9B/14A

Evidence: Examined gap or blocker remains in the supplied evidence. Reference: ED46; master line 1517.

Examined ledger finding: sign-in route waits on Q1. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: Select/build bounded auth route; do NOT assume direct workforce/Google issuer acceptance is the only solution

Expected check: successful/foreign/expired/revoked token cases

Dependency or boundary: HOST/ID

Host installation/consent works for declared customer profiles. PG S13/V20

Evidence: Examined gap or blocker remains in the supplied evidence. Reference: ED47; master line 1518.

Examined ledger finding: no permitted host. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: Decide supported versions and install path from evidence; backend placement still open

Expected check: admin-installed Windows/Mac/web/Docs receipts

Dependency or boundary: HOST/POLICY

Word unsupported APIs/capabilities produce explicit safe fallback, never unsafe apply. D9B lines800-804; T13

Evidence: Examined gap or blocker remains in the supplied evidence. Reference: ED48; master line 1519.

Examined ledger finding: no permitted host. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: Prove per-operation concurrency safety or keep preview/manual/verified-host-review fallback

Expected check: E4 adversarial race, unsafe mutation disabled

Dependency or boundary: HOST/DOC

Word Undo cannot rely on unsupported Office.js undo semantics. D9B; PG V7

Evidence: Not examined in this run; current implementation unknown. Reference: ED49; master line 1520.

Master work or verification: Demonstrate safe inverse operation under current revision/rights

Expected check: E8 plus concurrent edit test

Dependency or boundary: HOST/DOC

Docs consequential edits reject stale required revision rather than silently transform. D9B

Evidence: Not examined in this run; current implementation unknown. Reference: ED50; master line 1521.

Master work or verification: Test actual suggestion mode plus guard and refresh preview on stale result

Expected check: E11/E14 concurrency corpus

Dependency or boundary: HOST/DOC

Docs split named ranges and accepted/rejected suggestions retain correct anchors. D9C

Evidence: Not examined in this run; current implementation unknown. Reference: ED51; master line 1522.

Master work or verification: Detect split/ambiguous range before mutation

Expected check: split range, suggestion accept/reject

Dependency or boundary: HOST/DOC

Word content-control identity persists through host save/coauthor/copy/web paths. D9C

Evidence: Not examined in this run; current implementation unknown. Reference: ED52; master line 1523.

Master work or verification: Answer-only anchors plus document binding; prove persistence

Expected check: E1/E3, long-ID collision test

Dependency or boundary: HOST/BIND

Observe human/coauthor edits and label observation freshness. D9B; PG S13

Evidence: Not examined in this run; current implementation unknown. Reference: ED53; master line 1524.

Master work or verification: Bound observations, re-register callbacks, fresh read on reopen

Expected check: remote edit with pane open/closed

Dependency or boundary: HOST/DOC

Revoke permission at next protected operation even in already-open host session. D14A; PG S13/PT14

Evidence: Not examined in this run; current implementation unknown. Reference: ED54; master line 1525.

Master work or verification: Route every host action through current rights; token expiry/deployment removal insufficient

Expected check: E17 both hosts

Dependency or boundary: HOST/ID/RUN

Check destination collaborator audience before injecting private evidence. D14A; PG S13

Evidence: Not examined in this run; current implementation unknown. Reference: ED55; master line 1526.

Master work or verification: Compare permitted source audience with document recipients; safe deny or sanitized scope

Expected check: unauthorized collaborator T17

Dependency or boundary: HOST/FACT/ID

Beedy clean-output guarantee applies only verified export/print path, not arbitrary host export. D9C

Evidence: Not examined in this run; current implementation unknown. Reference: ED56; master line 1527.

Master work or verification: Publish tested path/fidelity boundary, not universal host guarantee

Expected check: arbitrary print clearly outside guarantee

Dependency or boundary: HOST/OUT

Native/Docs/Word use same bounded workflow/evidence/human-control rules. D7A; PG S12/S13

Evidence: Not examined in this run; current implementation unknown. Reference: ED57; master line 1528.

Master work or verification: Connect adapters to common command path, avoid divergent policy implementations

Expected check: same scenario across all required surfaces

Dependency or boundary: HOST/RUN/FACT/REV

Desktop editor journey supports Chrome/Edge/Firefox/Safari including Mac. PG V17

Evidence: Not examined in this run; current implementation unknown. Reference: ED58; master line 1529.

Master work or verification: Version-declared four-browser journey; no redesign prerequisite

Expected check: PG PT18

Dependency or boundary: DOC/ID

Provide supported add-in authentication without weakening current actor/organization checks.

Evidence: Not examined in this run; current implementation unknown. Reference: API-013; master line 1894.

Master work or verification: Build/test host route; assess site-session availability rather than asserting One API rejects every Google/Microsoft sign-in. Retain issuer/audience/membership checks.

Expected check: Real Word/Docs install and token/session flow, wrong issuer/audience/expiry denial, correct membership and revocation tests.

Disconnected office connectors do not block basic discovery/upload use.

Evidence: Not examined in this run; current implementation unknown. Reference: UXO016; master line 2413.

Master work or verification: No Docs/Word grants fixture can discover and upload; required host editing is still separate launch gate.

Disconnected Docs/Word shows stale observation and reconciles before current review/write/export claims.

Evidence: Not examined in this run; current implementation unknown. Reference: UXO040; master line 2437.

Master work or verification: Host integration required before executable test; editor workstream owns binding/read-back mechanisms.

Make editing accessible

Traceability group S08; safeguard.

Scope connection: WCAG 2.2 AA is an accessibility acceptance target across features, not another customer workflow. WCAG 2.2 AA and keyboard/assistive/zoom/contrast requirements apply to the existing capabilities, rather than fifteen independent features.

Evidence in this group: 16 unexamined in this run.

Editor and review meet approved WCAG 2.2 AA target. PG V19

Evidence: Not examined in this run; current implementation unknown. Reference: ED59; master line 1530.

Master work or verification: Keyboard/focus/reader/reflow and 2.2 criterion cases on named pairs

Expected check: PT18, not certification from code

Dependency or boundary: DOC/REV

Demonstrate WCAG 2.2 AA for implemented required scope.

Evidence: Not examined in this run; current implementation unknown. Reference: UXA001; master line 2319.

Master work or verification: Criterion-by-page evidence matrix and remediation; no conformance claim from code alone.

Required actions work by keyboard.

Evidence: Not examined in this run; current implementation unknown. Reference: UXA002; master line 2320.

Master work or verification: Manual end-to-end keyboard pass; unit key tests are partial only.

Focus movement and visibility remain correct through dialogs/errors/navigation.

Evidence: Not examined in this run; current implementation unknown. Reference: UXA003; master line 2321.

Master work or verification: Manual focus order, return, traps and visible focus fixtures.

Controls have meaningful accessible labels and understandable validation.

Evidence: Not examined in this run; current implementation unknown. Reference: UXA004; master line 2322.

Master work or verification: Rendered accessibility tree and validation review; field-name/unit labels are not full proof.

Assistive-technology core journey is tested on declared combinations.

Evidence: Not examined in this run; current implementation unknown. Reference: UXA005; master line 2323.

Master work or verification: Declare pairs and record screen-reader pass; VoiceOver/Safari, NVDA/JAWS are report suggestions, not selected policy.

200%/400% zoom and reflow preserve required content and actions.

Evidence: Not examined in this run; current implementation unknown. Reference: UXA006; master line 2324.

Master work or verification: Real rendered-page zoom/reflow checks, including mobile companion and dialogs.

Rendered contrast and non-color distinctions satisfy applicable AA criteria.

Evidence: Not examined in this run; current implementation unknown. Reference: UXA007; master line 2325.

Master work or verification: Measure actual rendered combinations; token-only 4.5:1 test is not every page.

Target sizes meet applicable WCAG 2.2 AA criterion 2.5.8.

Evidence: Not examined in this run; current implementation unknown. Reference: UXA008; master line 2326.

Master work or verification: Measure targets/exceptions on core pages and phone.

Keyboard focus is not obscured under 2.4.11.

Evidence: Not examined in this run; current implementation unknown. Reference: UXA009; master line 2327.

Master work or verification: Sticky headers, panels, modal and zoom focus checks.

Dragging functions have an applicable non-drag alternative under 2.5.7.

Evidence: Not examined in this run; current implementation unknown. Reference: UXA010; master line 2328.

Master work or verification: Source reclassification and other drag functions tested without dragging.

Help placement/availability satisfies consistent help 3.2.6.

Evidence: Not examined in this run; current implementation unknown. Reference: UXA011; master line 2329.

Master work or verification: Required page help inventory; exact persistent-shell placement remains unapproved.

Repeated data entry satisfies redundant-entry criterion 3.3.7.

Evidence: Not examined in this run; current implementation unknown. Reference: UXA012; master line 2330.

Master work or verification: Intake/application journey inventory and criterion exceptions.

Authentication satisfies accessible-authentication criterion 3.3.8.

Evidence: Not examined in this run; current implementation unknown. Reference: UXA013; master line 2331.

Master work or verification: Actual sign-in/recovery flow and chosen assistive-tech tests.

Forced-colours/reduced-motion behavior is verified where relevant.

Evidence: Not examined in this run; current implementation unknown. Reference: UXA014; master line 2332.

Master work or verification: Rendered OS/user-setting walkthrough; CSS presence alone does not establish usability.

Recovery/error states remain intelligible to keyboard and assistive-tech users.

Evidence: Not examined in this run; current implementation unknown. Reference: UXA015; master line 2333.

Master work or verification: Failure and retry journeys announced correctly, preserve position and actionable context.

Use supported desktop browsers

Traceability group I03; integration.

Scope connection: Chrome, Edge, Firefox and Safari are four required delivery surfaces of the same core product, not four independent capabilities.

Evidence in this group: 5 unexamined in this run.

Core desktop journey works in Chrome.

Evidence: Not examined in this run; current implementation unknown. Reference: UXM001; master line 2303.

Master work or verification: Versioned scripted complete journey, not headless screenshots alone.

Core desktop journey works in Edge.

Evidence: Not examined in this run; current implementation unknown. Reference: UXM002; master line 2304.

Master work or verification: Versioned Edge run; report found no evidence, not proven absence of compatibility.

Core desktop journey works in Firefox.

Evidence: Not examined in this run; current implementation unknown. Reference: UXM003; master line 2305.

Master work or verification: Versioned Firefox run with same core fixtures.

Core desktop journey works in Safari on Mac.

Evidence: Not examined in this run; current implementation unknown. Reference: UXM004; master line 2306.

Master work or verification: Recorded actual Mac Safari run; WebKit comments insufficient.

Declare supported browser/OS version ranges and build stamp.

Evidence: Not examined in this run; current implementation unknown. Reference: UXM005; master line 2307.

Master work or verification: Supported-version matrix; A reports no browser list. Do not invent exact minimum versions.

Use the mobile companion

Traceability group I04; integration.

Scope connection: Mobile lookup/review/accept-defer delivers existing customer capabilities. Mobile final approval is mapped to approval, with no full mobile authoring requirement.

Evidence in this group: 9 unexamined in this run.

Mobile organization lookup is available.

Evidence: Not examined in this run; current implementation unknown. Reference: UXM006; master line 2308.

Master work or verification: Actual declared phone/browser run; organization page not in supplied 390px capture.

Mobile application reading/review is usable.

Evidence: Not examined in this run; current implementation unknown. Reference: UXM007; master line 2309.

Master work or verification: S92 responsive reading exists; prove full required review, attachments and real-device controls.

Mobile accept/defer decisions use authorized shared records.

Evidence: Not examined in this run; current implementation unknown. Reference: UXM008; master line 2310.

Master work or verification: Actual phone triage and stale/permission tests; reachability currently only inferred.

Mobile decisions and desktop synchronize through the same authoritative record.

Evidence: Not examined in this run; current implementation unknown. Reference: UXM011; master line 2313.

Master work or verification: Cross-device read-after-write and explicit stale indication; push is not itself mandated.

Stale phone state cannot overwrite a newer desktop decision.

Evidence: Not examined in this run; current implementation unknown. Reference: UXM012; master line 2314.

Master work or verification: Expected revision/status guard and two-device conflict test; A locates absent stale guard.

Revoked mobile rights block next protected action.

Evidence: Not examined in this run; current implementation unknown. Reference: UXM013; master line 2315.

Master work or verification: Mid-session revocation on real mobile/browser plus backend denial.

Declare and test mobile OS/browser/version support.

Evidence: Not examined in this run; current implementation unknown. Reference: UXM014; master line 2316.

Master work or verification: Real-device support matrix, exact operation set, candidate and results.

Required companion controls remain legible/reachable at narrow widths.

Evidence: Not examined in this run; current implementation unknown. Reference: UXM015; master line 2317.

Master work or verification: Fix clipped Opportunities badge S91 and inspect all companion routes beyond four screenshots.

Do not require full phone application writing or mobile Docs add-ons.

Evidence: Not examined in this run; current implementation unknown. Reference: UXM016; master line 2318.

Master work or verification: Product/acceptance matrix distinguishes companion web from desktop host editing; no extra scope inferred.

Provide coherent navigation and understandable interactions

Traceability group S16; safeguard.

Scope connection: Brand, context, loading/empty/error behavior, list navigation, dates and language are common interface quality conditions. Unapproved visual details are not approved new features.

Evidence in this group: 16 unexamined in this run.

Build on the actual existing frontend, rather than assume a replacement UI.

Evidence: Not examined in this run; current implementation unknown. Reference: UX001; master line 2258.

Master work or verification: Map actual routes/screens to contract; change only measured gaps; exclude withdrawn Azure URL.

Use centring.ai general feel and the same Beedy character.

Evidence: Not examined in this run; current implementation unknown. Reference: UX002; master line 2259.

Master work or verification: Compare approved assets and actual app; record which assets are reused.

Carry Atkinson Hyperlegible and Good Company+ references without inventing absent brand values.

Evidence: Not examined in this run; current implementation unknown. Reference: UX003; master line 2260.

Master work or verification: Retrieve approved assets/font licenses/tokens; no fabricated palette or scale.

Keep the app practical, uncluttered, intuitive, useful and delightful, with visible work.

Evidence: Not examined in this run; current implementation unknown. Reference: UX004; master line 2261.

Master work or verification: Task walkthrough with real screen inventory and user-centered evidence; no aesthetic redesign inferred.

Treat character animation/placement and exact layout as unapproved design choices.

Evidence: Not examined in this run; current implementation unknown. Reference: UX005; master line 2262.

Master work or verification: Separate accepted behavior from optional design proposal in screen map.

Funders, People and Organization stay accessible outside core drafting loop.

Evidence: Not examined in this run; current implementation unknown. Reference: UX013; master line 2270.

Master work or verification: Route inventory proves authorized access without a current application; do not impose six-item nav.

Show correct organization context; add switcher only if real account cardinality supports it.

Evidence: Not examined in this run; current implementation unknown. Reference: UX014; master line 2271.

Master work or verification: Identity/context tests plus screen evidence; no invented multi-org model.

Loading preserves context and distinguishes initial loading, refresh and save progress.

Evidence: Not examined in this run; current implementation unknown. Reference: UX015; master line 2272.

Master work or verification: Loading fixtures on every required route; no premature empty or saved state.

Empty states explain actual absence and offer an authorized next step.

Evidence: Not examined in this run; current implementation unknown. Reference: UX016; master line 2273.

Master work or verification: Empty/unknown/failure/denied cases tested separately across required screens.

Errors say what failed, what is safe and what may be retried.

Evidence: Not examined in this run; current implementation unknown. Reference: UX017; master line 2274.

Master work or verification: Failure walkthroughs retain meaningful context and recoverable action.

Funder and internal deadlines, time zone and precision stay distinguishable.

Evidence: Not examined in this run; current implementation unknown. Reference: UX027; master line 2284.

Master work or verification: Date-only/unknown-zone/rolling fixtures; no invented close time/countdown.

Lists expose applied filters and reset.

Evidence: Not examined in this run; current implementation unknown. Reference: UX028; master line 2285.

Master work or verification: Filter chips/control readout and reset preserve complete authorized result set.

Returning from a record preserves search/pagination context.

Evidence: Not examined in this run; current implementation unknown. Reference: UX029; master line 2286.

Master work or verification: Navigate record/back with filters and nonfirst page; no inaccessible-count leakage.

A toast is never the only record of a result, failed job or required decision.

Evidence: Not examined in this run; current implementation unknown. Reference: UX030; master line 2287.

Master work or verification: Reload after notification/error; durable status remains accessible.

Use text alongside color for statuses.

Evidence: Not examined in this run; current implementation unknown. Reference: UX031; master line 2288.

Master work or verification: Rendered status coverage including both themes and non-color distinction.

English UI remains the launch interface language.

Evidence: Not examined in this run; current implementation unknown. Reference: UX032; master line 2289.

Master work or verification: UI language inventory; source-translation requirement belongs to intake section.

Drafter and application preparation

Inspect application and document revision history

Traceability group F12; capability.

Scope connection: Attributed transition and important-version history. One distinct inspection/history outcome preserving actor, revisions, lineage and model provenance.

Evidence in this group: 1 partial merged; 2 unexamined in this run.

Lifecycle history preserves attributed dated transitions and important versions. G S17.

Evidence: Only part merged; finish the residual and accept. Reference: LC029; master line 1091.

Master work or verification: Retain and expose usable history for new archive/delete/submission records.

Expected check: Actor/time/scope shown; old submitted set never rewritten.

Model provenance survives accepted rewording. D4/9C; PG S17

Evidence: Not examined in this run; current implementation unknown. Reference: ED09; master line 1480.

Master work or verification: Verify every rewording accept path retains author kind/history

Expected check: accepted rewording provenance test

Dependency or boundary: DOC

Visible answer/document history preserves actor, lineage and previous revisions. D4/9C; PG S17

Evidence: Not examined in this run; current implementation unknown. Reference: ED13; master line 1484.

Master work or verification: Expose existing/new append-only answer versions

Expected check: open and compare older accepted revision

Dependency or boundary: DOC/ID

Draft application attachments

Traceability group F21; capability.

Scope connection: Attachment authoring, not merely metadata/upload.

Evidence in this group: 1 unexamined in this run.

Support drafting application-package attachments, not merely recording their metadata or uploading prewritten files. AC §5 approved direction and its explicit metadata-versus-drafting distinction; D R01/R14 supplies coherent drafting/human-control context.

Evidence: Not examined in this run; current implementation unknown. Reference: DA01; master line 199.

Master work or verification: Add an explicit authoring route to the existing type-aware drafting workflow for supported authored attachments actually required by the funder. Identify applicability from sourced instructions and distinguish draftable narrative material from records that must be supplied by the user or issuing organization. Inventory existing support before implementing. Do not equate generic answer text, metadata or final-file upload with this capability.

Expected check: Use a sourced fixture requiring an authored narrative attachment. Beedy prepares a source-grounded reviewable draft in the applicable output form; human edits and acceptance remain attributable; checklist links the actual chosen version; clean export and submitted-set capture preserve its exact content. Pair with an official-record/signature fixture: no invented or automatically signed substitute. Declare tested type boundaries rather than claim universal attachment authoring.

Dependency or boundary: Actual requirements DR03/09/29-32; scoped evidence EV01-22; human proposal/acceptance ED06/09; package checklist AP25; clean output EX01-11; exact submitted files EX15-25. WP06 and later Batch C, then package acceptance. Approved product direction in AC. Exact supported attachment types, templates, file formats and authoring methods are not settled by this sentence. It does not authorize fabricating official records, signing documents, making commitments or creating technical certifications.

Generate a coherent application draft

Traceability group F22; capability.

Scope connection: Controlled hybrid and intelligence use are methods/quality contracts; campaign document types are output variants. One whole-application generation outcome. Internal planning, clarification, letter/LOI/sponsorship formats and coordinated generation are methods or variants, not separate feature counts.

Evidence in this group: 2 whole merged; 21 unexamined in this run.

Use the approved controlled hybrid across supported drafting entry points: upfront dependency planning, parallel independent retrieval/evidence packets, bounded gap/conflict/interview loops, complete drafting, semantic/source and deterministic checks, then human review. AC §9; D §1A R01/R09/R14 and §7A.

Evidence: Reported whole implementation merged; acceptance remains. Reference: DA02; master line 200.

Master work or verification: Add one explicit orchestration acceptance item joining existing DR/RUN/EV controls. Inspect and reuse the current planner/runtime; connect prepared-project, question-redraft, local-edit and resumed-interview paths to consistent evidence/human-control rules. Permit concurrent independent reads; guard accepted writes. Replan only affected dependencies, preserve valid outputs, and enforce already approved scope/spend/permission constraints.

Expected check: Trace a prepared-project fixture straight to coherent complete draft without mandatory development interview. Trace a material-conflict fixture to saved progress, useful clarification, explicit human choice and resumed affected work. Trace a local edit without full-app restart. Show permitted independent retrieval concurrency, bounded termination, semantic/source and deterministic checks, retained useful outputs and human adoption separate from worker completion. Verify current requirements/access/version changes invalidate only affected reuse; never claim quality from orchestration traces alone.

Dependency or boundary: DR17-26; EV12-21/29-37; RX01-05; ED57; RUN-002/004/005/006/007/008; API accepted-record authority and paid admission controls. WP06/Batch C; Batch A demonstrates plumbing only, not complete hybrid or quality acceptance. Approved workflow direction, not a mandate to replace the current engine or adopt a new framework because of its name. Exact graph representation, physical services, planner/solver algorithms, concurrency counts, model choices and numerical operating limits remain engineering choices or unresolved parameters. ReWOO/ReAct names alone do not demonstrate the required behavior.

Use applicable, currently permitted funder/program/round intelligence for matching and draft tailoring, keeping stated feedback, observed patterns and inference distinct. Approved design comparison §6 and Drafter §12.

Evidence: Not examined in this run; current implementation unknown. Reference: DA04; master line 207.

Master work or verification: Trace authorized dated observations through existing profiles/evidence to relevant match explanation and draft proposal; link PE13-15/19-20, VO13-14, EV01-03/41 and DR16. No new shared dataset or consent inferred.

Expected check: Correct-scope current observation informs an attributed explanation or proposal; wrong-round, stale, withdrawn or unauthorized information is excluded or qualified. No private cross-tenant reuse, invented scoring or automatic outreach.

Identify route/output type, including routes with no formal question list and required submission documents, rather than generic question workaround.

Evidence: Not examined in this run; current implementation unknown. Reference: WA10; master line 240.

Master work or verification: Extend type-aware requirements intake using actual instructions; keep attachment policy grounded.

Expected check: No-form letter instructions produce appropriate letter and required-document checklist without invented official questions.

Capital-campaign writing includes case for support.

Evidence: Not examined in this run; current implementation unknown. Reference: WA15; master line 245.

Master work or verification: Reuse type-aware writing pipeline with campaign/program context; no new campaign-management system.

Expected check: Supply campaign brief and source facts; produce appropriate case for support with source-grounded amounts/commitments and human review.

Capital-campaign writing includes budget narrative.

Evidence: Not examined in this run; current implementation unknown. Reference: WA16; master line 246.

Master work or verification: Reuse type-aware writing pipeline with campaign/program context; no new campaign-management system.

Expected check: Supply campaign brief and source facts; produce appropriate budget narrative with source-grounded amounts/commitments and human review.

Capital-campaign writing includes donor letters.

Evidence: Not examined in this run; current implementation unknown. Reference: WA17; master line 247.

Master work or verification: Reuse type-aware writing pipeline with campaign/program context; no new campaign-management system.

Expected check: Supply campaign brief and source facts; produce appropriate donor letters with source-grounded amounts/commitments and human review.

Capital-campaign writing includes sponsorship material.

Evidence: Not examined in this run; current implementation unknown. Reference: WA18; master line 248.

Master work or verification: Reuse type-aware writing pipeline with campaign/program context; no new campaign-management system.

Expected check: Supply campaign brief and source facts; produce appropriate sponsorship material with source-grounded amounts/commitments and human review.

Capital-campaign writing includes related campaign narrative.

Evidence: Not examined in this run; current implementation unknown. Reference: WA19; master line 249.

Master work or verification: Reuse type-aware writing pipeline with campaign/program context; no new campaign-management system.

Expected check: Supply campaign brief and source facts; produce appropriate related campaign narrative with source-grounded amounts/commitments and human review.

Complex grants remain supported in main Beedy; complexity alone is not reason to defer or move to separate product.

Evidence: Not examined in this run; current implementation unknown. Reference: WA21; master line 251.

Master work or verification: Retain complex-grant path and test finite realistic questions/attachments; represent actual limits honestly.

Expected check: Complex eligible grant stays in main workflow; no complexity-only rejection or compulsory separate-product handoff.

Search readiness and drafting readiness are separate: drafting needs one concrete program/project, potentially developed from rough idea through adaptive interview.

Evidence: Not examined in this run; current implementation unknown. Reference: WA30; master line 260.

Master work or verification: Allow search before program ready; prompt first program and use adaptive development before submission-oriented drafting, respecting later Q35-37 adoption.

Expected check: Legal/org-only profile can search; draft initiation asks for meaningful program context rather than fabricating program from EIN/name/mission; sufficient prepared plan bypasses unnecessary interview.

Build internal application-wide case/coverage graph before drafting. D §5B; PG S12/PT07

Evidence: Not examined in this run; current implementation unknown. Reference: DR17; master line 1379.

Master work or verification: Bounded planning step reusing pipeline, not a customer-facing plan product

Expected check: T01 coverage chain

Dependency or boundary: REQ/FACT/RUN

Link need, activities, outcomes, measurement, responsibility and budget coherently. D §5B

Evidence: Not examined in this run; current implementation unknown. Reference: DR18; master line 1380.

Master work or verification: Add coverage/dependency links, then assess whole output

Expected check: T01/T19 blinded case coherence

Dependency or boundary: FACT/REQ

Internal case planning has no mandatory inspection/approval gate. D §5B; PG §23 Q33/Q34, X13

Evidence: Not examined in this run; current implementation unknown. Reference: DR19; master line 1381.

Master work or verification: Keep internal execution artifact; separately authorize commitments

Expected check: prepared project drafts directly, T02

Dependency or boundary: RUN/ID

Prepared projects take a direct complete-draft route. D §5B-C; Q6/Q21

Evidence: Not examined in this run; current implementation unknown. Reference: DR20; master line 1382.

Master work or verification: Test sufficient case without forced long interview

Expected check: T02/PT21

Dependency or boundary: REQ/FACT/RUN

Consequential application-changing forks pause for clarification. D §5C

Evidence: Not examined in this run; current implementation unknown. Reference: DR21; master line 1383.

Master work or verification: Explain why answer matters; present source-backed alternatives

Expected check: seeded purpose/population/commitment forks T02

Dependency or boundary: RUN/FACT

Clarification supports narrow/confirm-provisional/pause choices without calling attestation verification. D §5C

Evidence: Not examined in this run; current implementation unknown. Reference: DR22; master line 1384.

Master work or verification: Preserve decision and consequences; no invented confidence threshold

Expected check: four-choice fork fixture

Dependency or boundary: ID/RUN

Minor gaps produce local questions/placeholders, not whole-project redevelopment. D §5C

Evidence: Not examined in this run; current implementation unknown. Reference: DR23; master line 1385.

Master work or verification: Verify locality and unsupported assertions omitted/qualified

Expected check: minor-gap T02/PT07

Dependency or boundary: REQ/RUN

Draft whole application before per-question refinement. D §5C

Evidence: Not examined in this run; current implementation unknown. Reference: DR24; master line 1386.

Master work or verification: Connect whole-case execution before local polish

Expected check: inspect run graph/output T01/T19

Dependency or boundary: REQ/FACT/RUN

One drafting call when evaluated budget fits; otherwise coordinated groups share outline/facts and synthesize before polish. D §5C

Evidence: Not examined in this run; current implementation unknown. Reference: DR25; master line 1387.

Master work or verification: Benchmark strategies; do not prescribe one call for every size

Expected check: T19/T20 cost/quality/size comparison

Dependency or boundary: RUN

Start paid draft only after explicit disclosed scope/allowance initiation, not Pursue. PG S07/S12

Evidence: Reported whole implementation merged; acceptance remains. Reference: DR27; master line 1389.

Master work or verification: Separate preparation/start and display estimate versus max

Expected check: pursue/no-spend then explicit-start fixture

Dependency or boundary: RUN/REQ

Produce close-to-final coherent natural-voice answers without routine Centring writing. Q6; PG V10/PT21

Evidence: Not examined in this run; current implementation unknown. Reference: DR28; master line 1390.

Master work or verification: End-to-end sufficiently supplied fixture with concierge off and editing-burden measurement

Expected check: PT21/T19, no invented A-minus numeric score

Dependency or boundary: FACT/VOICE/RUN

LOI/one-to-two-page letters use type-aware requirements/output. Q13; PG S10/S12

Evidence: Not examined in this run; current implementation unknown. Reference: DR29; master line 1391.

Master work or verification: Reuse drafter with suitable template and actual instructions

Expected check: short-letter fixture

Dependency or boundary: REQ/DOC/OUT

Sponsorship forms are type-aware, not flattened into generic questionnaire. Q13; PG S10

Evidence: Not examined in this run; current implementation unknown. Reference: DR30; master line 1392.

Master work or verification: Add bounded form type using actual questions

Expected check: sponsorship fixture

Dependency or boundary: REQ/OUT

Capture and adopt actual application requirements

Traceability group F42; capability.

Scope connection: One intake/adoption outcome across upload, paste, manual and scraped questions; wording, source, counting rules and source rubrics are attributes and safeguards, not separate features.

Evidence in this group: 17 unexamined in this run.

Reuse actual publicly scraped application questions when available as proposed intake, rather than requiring users to re-enter them or substituting generic questions. Partial Q50, DEC535-537: “If we can pull it from our scraping, like if we scrape and they're like, oh, here's the questions for like this application. That will supply that”.

Evidence: Not examined in this run; current implementation unknown. Reference: DR57; master line 313.

Master work or verification: Connect publicly available actual question extraction to the same proposed requirement set, with source/round, ambiguity review and deliberate adoption. No behind-portal acquisition or automation is inferred.

Expected check: Accessible official current-round questions arrive with exact wording/order/sub-asks/source and can be corrected/adopted. Wrong-round, inaccessible or partial source remains labeled incomplete; no invented official set.

Preserve supplied question wording. D §5A; PG S10/PT06

Evidence: Not examined in this run; current implementation unknown. Reference: DR01; master line 1363.

Master work or verification: Demonstrate exact wording survives both routes, including extraction correction

Expected check: compare input/adopted/output text

Dependency or boundary: REQ

Preserve original question order and sub-asks. D §5A; PG S10

Evidence: Not examined in this run; current implementation unknown. Reference: DR02; master line 1364.

Master work or verification: Test reordered/multi-part questions without dropped sub-asks

Expected check: PT06/T01 fixture

Dependency or boundary: REQ

Store question answer type and attachment constraints. D §5A

Evidence: Not examined in this run; current implementation unknown. Reference: DR03; master line 1365.

Master work or verification: Map every extracted constraint to adopted requirement and output checks

Expected check: type/attachment fixtures

Dependency or boundary: REQ/OUT

Retain question-level source locator and source revision/round. D §5A

Evidence: Not examined in this run; current implementation unknown. Reference: DR04; master line 1366.

Master work or verification: Add locator to existing versioned questions; no replacement source system

Expected check: open exact source passage from each question

Dependency or boundary: REQ/FACT

Manual question entry works. PG S10/PT06

Evidence: Not examined in this run; current implementation unknown. Reference: DR05; master line 1367.

Master work or verification: Retest on release candidate; not a production claim

Expected check: enter and reopen real-shaped questions

Dependency or boundary: REQ/ID

Paste actual questions without an invented official set. PG S10

Evidence: Not examined in this run; current implementation unknown. Reference: DR06; master line 1368.

Master work or verification: Verify paste parsing/correction and partial preservation

Expected check: pasted multi-question fixture

Dependency or boundary: REQ

Uploaded questions remain proposed until human ambiguity/coverage resolution. D §5A; PG S10

Evidence: Not examined in this run; current implementation unknown. Reference: DR07; master line 1369.

Master work or verification: Prove ambiguous/partial extraction remains visible and not silently adopted

Expected check: partial scanned fixture

Dependency or boundary: REQ/FACT

Keep original and partial work when extraction fails. D §5A/C; PG S10

Evidence: Not examined in this run; current implementation unknown. Reference: DR08; master line 1370.

Master work or verification: Exercise upload failure and correction without source loss

Expected check: reopen original after failure

Dependency or boundary: REQ/FACT

Compare and deliberately adopt replacement question set with impact. PG S10/PT06; F §12C

Evidence: Not examined in this run; current implementation unknown. Reference: DR09; master line 1371.

Master work or verification: Connect adopted-set change to affected drafts/reviews

Expected check: changed-order/changed-limit fixture

Dependency or boundary: REQ/REV

Redraft reads current adopted requirement revision. D §5C lines522-524

Evidence: Not examined in this run; current implementation unknown. Reference: DR10; master line 1372.

Master work or verification: Trace actual current-set read and reject stale input fingerprint

Expected check: change question then redraft

Dependency or boundary: REQ/RUN

Generic preparation questions are never official funder requirements. D §5A; PG S10

Evidence: Not examined in this run; current implementation unknown. Reference: DR11; master line 1373.

Master work or verification: Label preparation-only and prevent satisfying actual coverage

Expected check: generic-only package never falsely Ready

Dependency or boundary: REQ/REV

No-form attestation records actor/date/basis; inaccessible portal remains partial. D §5A

Evidence: Not examined in this run; current implementation unknown. Reference: DR12; master line 1374.

Master work or verification: Add/verify bounded attestation rather than assuming inaccessible means no form

Expected check: inaccessible-portal fixture

Dependency or boundary: REQ/ID

Word limits retain source counting rules. D §5A; PG S10

Evidence: Not examined in this run; current implementation unknown. Reference: DR13; master line 1375.

Master work or verification: Validate exact word-count policy and boundary conditions

Expected check: golden count fixture

Dependency or boundary: REQ/DOC

Character limits retain source counting rules separately. D §5A

Evidence: Not examined in this run; current implementation unknown. Reference: DR14; master line 1376.

Master work or verification: Validate spaces/newlines/Unicode per actual source rule

Expected check: character boundary fixture

Dependency or boundary: REQ/DOC

Page limits use named render profile and rendered pages, including fonts/margins/tables. D §5A lines472-475

Evidence: Not examined in this run; current implementation unknown. Reference: DR15; master line 1377.

Master work or verification: Implement only applicable page-limit path; do not use words-per-page proxy

Expected check: render/table/font page-count fixture

Dependency or boundary: REQ/OUT

Rubric criteria/weights need published source; no invented scoring preferences. D §5A

Evidence: Not examined in this run; current implementation unknown. Reference: DR16; master line 1378.

Master work or verification: Store sourced criteria and label inferred funder observations separately

Expected check: absent-rubric fixture and source inspection

Dependency or boundary: REQ/FACT

Draft pre-application outreach and meeting preparation

Traceability group F43; capability.

Scope connection: Prepare context-aware material for initial or exception inquiry and conversations; delivery formats are collapsed. Does not send.

Evidence in this group: 4 unexamined in this run.

First-contact program-officer email/message drafts use application/profile context, without sending. Q13; PG S10

Evidence: Not examined in this run; current implementation unknown. Reference: DR31; master line 1393.

Master work or verification: Add short draft kind, not outreach automation

Expected check: context/right-recipient-purpose fixture

Dependency or boundary: FACT/REQ

Meeting talking points are supported, distinct from meeting notes. Q13; PG S10

Evidence: Not examined in this run; current implementation unknown. Reference: DR32; master line 1394.

Master work or verification: Add bounded talking-point output

Expected check: source-grounded points fixture

Dependency or boundary: FACT/REQ

Missing funder-required evidence can generate eligibility/exception-question draft for user. Q26; PG §23

Evidence: Not examined in this run; current implementation unknown. Reference: DR33; master line 1395.

Master work or verification: Reuse short-document kind; never waive funder rule

Expected check: missing-990 eligibility inquiry fixture

Dependency or boundary: REQ/FACT

Funder-specific missing required record prompts eligibility/exception-question draft, never waiver.

Evidence: Not examined in this run; current implementation unknown. Reference: IN10; master line 528.

Master work or verification: P2/application-type dependency: draft grounded question for user to send.

Expected check: Grant requires unavailable audit; warning and draft cite requirement; no auto-send or waived Ready check.

Dependency or boundary: Centring verification is not funder eligibility approval.

Find and assess supporting research

Traceability group F44; capability.

Scope connection: One bounded research and support-assessment outcome; passage checks, applicability, retractions, contrary findings and confidence labels are acceptance conditions, not separate features.

Evidence in this group: 11 unexamined in this run.

Search permitted organization evidence before bounded approved external research. D §6B

Evidence: Not examined in this run; current implementation unknown. Reference: EV12; master line 1415.

Master work or verification: Trace source selection and permitted research budget

Expected check: research-empty versus local-sufficient fixture

Dependency or boundary: FACT/RUN

Study identity, title, authors, date and direct study/publisher link are checked. D §6B

Evidence: Not examined in this run; current implementation unknown. Reference: EV13; master line 1416.

Master work or verification: Named study identity fixture, including plausible false citation

Expected check: T03 retained check receipt

Dependency or boundary: FACT/RUN

Inspect actual supporting passage rather than search metadata/model agreement. D §6B

Evidence: Not examined in this run; current implementation unknown. Reference: EV14; master line 1417.

Master work or verification: Preserve checked passage and exact claim support

Expected check: T03 full-text/metadata-only contrast

Dependency or boundary: FACT

Assess study design/population/exposure/comparison/outcome/context and applicability. D §6B

Evidence: Not examined in this run; current implementation unknown. Reference: EV15; master line 1418.

Master work or verification: Bounded support assessment per claim, not generic confidence

Expected check: T03 non-applicable population/causal leap fixture

Dependency or boundary: FACT

Record correction/retraction check and date. D §6B

Evidence: Not examined in this run; current implementation unknown. Reference: EV16; master line 1419.

Master work or verification: Show verified/check-incomplete state separately

Expected check: retracted-source fixture

Dependency or boundary: FACT/RUN

Abstract-only access permits only narrow attributed support; missing full text/tables stays visible. D §6B

Evidence: Not examined in this run; current implementation unknown. Reference: EV17; master line 1420.

Master work or verification: Preserve access gap without claiming disproven or fully verified

Expected check: abstract-only T03

Dependency or boundary: FACT

Supported / needs qualification / contradicted / insufficient support are distinct. D §6B

Evidence: Not examined in this run; current implementation unknown. Reference: EV18; master line 1421.

Master work or verification: Map dispositions with evidence/reason, never equate unknown and false

Expected check: T03 four-state fixture

Dependency or boundary: FACT/REV

Identity checked, passage checked, applicability assessed and user reviewed remain separate. D §6B

Evidence: Not examined in this run; current implementation unknown. Reference: EV19; master line 1422.

Master work or verification: Separate check dimensions, not single green score

Expected check: incomplete-dimension fixture

Dependency or boundary: FACT/REV

Retain contradictory/negative findings and selection rationale. D §6B

Evidence: Not examined in this run; current implementation unknown. Reference: EV20; master line 1423.

Master work or verification: Prevent popularity/recency/model voting from hiding contrary evidence

Expected check: contradictory-study fixture

Dependency or boundary: FACT

Uncertain research stays outside generated supported prose; user may separately incorporate qualified attributed wording. D §6B

Evidence: Not examined in this run; current implementation unknown. Reference: EV21; master line 1424.

Master work or verification: Sidebar gaps/direct links and explicit incorporation choice

Expected check: unsupported-study T03

Dependency or boundary: FACT/DOC

User-authored unsupported prose stays editable with nonblocking source-specific warning. D §1C/6B; PG V13/S11

Evidence: Not examined in this run; current implementation unknown. Reference: EV22; master line 1425.

Master work or verification: Prove manual text never silently replaced/blocked solely for missing evidence

Expected check: PT10 paired human-attestation case

Dependency or boundary: DOC/REV

Review application consistency and submission readiness

Traceability group F45; capability.

Scope connection: Quick Check, affected cross-answer checks, version-bound review completion and reopening form one current-application review capability. No paid research automatically follows invalidation. One actual-requirement package checklist/readiness determination; attestation, missing requirements and continued editing/download are rules within it.

Evidence in this group: 21 unexamined in this run; 1 whole merged.

Typed saves recompute facts-used rather than leaving stale dependencies. PG A1 errata

Evidence: Not examined in this run; current implementation unknown. Reference: EV23; master line 1426.

Master work or verification: Preserve corrected report reading; regress dependency trace

Expected check: typed number-change fixture

Dependency or boundary: DOC/FACT

Value/unit/period change marks actually dependent answers stale. D §6C

Evidence: Not examined in this run; current implementation unknown. Reference: EV24; master line 1427.

Master work or verification: Retest on candidate including multi-answer dependencies

Expected check: affected-only invalidation

Dependency or boundary: FACT/REV

Status change alone (proposed/achieved, pledged/secured) also invalidates affected support. D §4C/6C

Evidence: Not examined in this run; current implementation unknown. Reference: EV25; master line 1428.

Master work or verification: Include status in version/dependency comparison

Expected check: status-only T04

Dependency or boundary: FACT/REV

An unrelated upload does not invalidate completed review. D §6C

Evidence: Not examined in this run; current implementation unknown. Reference: EV26; master line 1429.

Master work or verification: Dependency-scoped comparison rather than blanket reopening

Expected check: unrelated-upload T04

Dependency or boundary: FACT/REV

Relevant candidate replacement prompts comparison, not automatic invalidation before adoption. D §6C

Evidence: Not examined in this run; current implementation unknown. Reference: EV27; master line 1430.

Master work or verification: Separate candidate notice from authority change

Expected check: unadopted-replacement fixture

Dependency or boundary: FACT/REV

Adopted/withdrawn/changed dependency reopens only affected question review with reason. D §6C

Evidence: Not examined in this run; current implementation unknown. Reference: EV28; master line 1431.

Master work or verification: Link support and question-review dependencies

Expected check: T04 source/fact/commitment changes

Dependency or boundary: FACT/REV

Per-question review completion binds exact text/block/requirements/support/authority/calculation/commitment revisions. D §6C/10A

Evidence: Not examined in this run; current implementation unknown. Reference: EV29; master line 1432.

Master work or verification: Verify separate review record or add bounded manifest

Expected check: exact input vector inspect

Dependency or boundary: REV/DOC/FACT

Completing a question review stops automatic research for that version. D §6C/10A

Evidence: Not examined in this run; current implementation unknown. Reference: EV30; master line 1433.

Master work or verification: Persist completion as research-stop boundary

Expected check: repeated view/reopen emits no paid call

Dependency or boundary: REV/RUN

Reopening preserves historical completion. D §6C

Evidence: Not examined in this run; current implementation unknown. Reference: EV31; master line 1434.

Master work or verification: Append new review state rather than rewrite prior record

Expected check: compare before/after history

Dependency or boundary: REV/DOC

Cosmetic carry-forward requires recorded equivalence; semantic digest alone is insufficient. D §4C/6C

Evidence: Not examined in this run; current implementation unknown. Reference: EV32; master line 1435.

Master work or verification: Deterministic changes plus equivalence receipt

Expected check: punctuation versus negation/number T04

Dependency or boundary: REV/DOC

Unchanged moved claim retains support only when context equivalent. D §6C/9C

Evidence: Not examined in this run; current implementation unknown. Reference: EV33; master line 1436.

Master work or verification: Stable block identities and context-aware movement

Expected check: moved and duplicated claim T12

Dependency or boundary: DOC/FACT

Uncertain free-text meaning triggers human review without automatically invoking a model. D §6C

Evidence: Not examined in this run; current implementation unknown. Reference: EV34; master line 1437.

Master work or verification: Cheap change detector marks uncertainty, no paid auto-research

Expected check: ambiguous-negation fixture

Dependency or boundary: DOC/REV/RUN

Invalidation never starts paid verification; user initiates named affected scope. D §6C/10A

Evidence: Not examined in this run; current implementation unknown. Reference: EV35; master line 1438.

Master work or verification: Distinguish invalidation from new bounded job

Expected check: source-change ledger shows zero automatic paid dispatch

Dependency or boundary: REV/RUN

Quick Check uses current text/known evidence for numbers/dates/commitments/answers/limits/mismatches, no deep research by default. D §6C; PG S15

Evidence: Not examined in this run; current implementation unknown. Reference: EV36; master line 1439.

Master work or verification: Connect bounded known-input checks with explicit scope

Expected check: PT07/T04 Quick Check trace

Dependency or boundary: DOC/FACT/REV

Targeted edit/redraft triggers affected cross-answer consistency review. D §7A; PG S12

Evidence: Not examined in this run; current implementation unknown. Reference: EV37; master line 1440.

Master work or verification: Reuse whole-draft checker on dependency-scoped affected answers

Expected check: number/date disagreement fixture

Dependency or boundary: DOC/FACT/REV

Review findings identify affected text, evidence/calculation, reason and practical action. D10A

Evidence: Not examined in this run; current implementation unknown. Reference: AP02; master line 1538.

Master work or verification: Demonstrate substantive actionable findings, not generic critique

Expected check: T19 scored examples

Dependency or boundary: REV/FACT/DOC

Review distinguishes demonstrated error, reasoned judgment and preference. D10A

Evidence: Not examined in this run; current implementation unknown. Reference: AP03; master line 1539.

Master work or verification: Preserve differing judgment and human disposition

Expected check: disagreeing-reviewer fixture

Dependency or boundary: REV

Finance/program/technical perspectives cover applicable scope without mandating permanent specialist agents. D10A

Evidence: Not examined in this run; current implementation unknown. Reference: AP04; master line 1540.

Master work or verification: Bounded perspective checks over shared evidence; roster implementation optional

Expected check: required-domain T19 cases

Dependency or boundary: REV/FACT

Missing evidence warns but writing remains open. PG V13; D1C/6B

Evidence: Not examined in this run; current implementation unknown. Reference: AP22; master line 1558.

Master work or verification: Do not extend evidence advisories into blanket edit gate

Expected check: PT10 unsupported-human prose

Dependency or boundary: DOC/FACT

Authorized human attestation may permit Ready on otherwise compliant package without independent-verification label. PG V13

Evidence: Not examined in this run; current implementation unknown. Reference: AP23; master line 1559.

Master work or verification: Apply selected attestation grant, preserve unsupported state and actor

Expected check: PT10 positive attestation case

Dependency or boundary: ID/REV/FACT

Actual unmet funder requirement blocks Ready, while editing and download remain. PG V13

Evidence: Reported whole implementation merged; acceptance remains. Reference: AP24; master line 1560.

Master work or verification: Keep hard Ready gate, connect independent download

Expected check: missing attachment/over-limit pair

Dependency or boundary: REQ/REV/OUT

Package checklist derives from actual form/guidance/attachments/registrations/portal steps with source/owner/deadline/evidence/uncertainty. D10C

Evidence: Not examined in this run; current implementation unknown. Reference: AP25; master line 1561.

Master work or verification: Trace actual requirement to checklist, keep unavailable portal partial

Expected check: T09 incomplete portal fixture

Dependency or boundary: REQ/REV

Learn and manage organization writing voice

Traceability group F46; capability.

Scope connection: Learn scoped style, inspect/delete preferences and reset/withdraw samples; factual edits and local funder choices do not silently become style.

Evidence in this group: 10 unexamined in this run.

Learn natural voice from available authorized organization writing; no mandatory extra-samples request. Q supplemental voice; I5.3; PG S19

Evidence: Not examined in this run; current implementation unknown. Reference: VO01; master line 1451.

Master work or verification: Verify normal drafting consumes authorized existing writing without compulsory new samples

Expected check: supplied-writing/no-new-upload fixture

Dependency or boundary: FACT/RUN

Explicitly accepted style guidance is separate from inferred preferences. I5.3; D12B

Evidence: Not examined in this run; current implementation unknown. Reference: VO02; master line 1452.

Master work or verification: Attribute guidance, retain acceptance/source/version

Expected check: explicit-versus-inferred fixture

Dependency or boundary: FACT/ID

Voice has organization and delivery-program scope. I5.3

Evidence: Not examined in this run; current implementation unknown. Reference: VO03; master line 1453.

Master work or verification: Verify selected program voice does not contaminate unrelated program

Expected check: two-program style canary

Dependency or boundary: FACT/RUN

Voice sample records provenance, rights, intended audience and effective version. I5.3

Evidence: Not examined in this run; current implementation unknown. Reference: VO04; master line 1454.

Master work or verification: Inventory fields and enforce source purpose at use

Expected check: withdrawn/restricted sample fixture

Dependency or boundary: FACT/ID

Dollar/commitment/factual edits never become style memory. I5.3; D12B; PG S19

Evidence: Not examined in this run; current implementation unknown. Reference: VO05; master line 1455.

Master work or verification: Classify accepted rewrite changes before memory admission

Expected check: numeric edit does not alter style facts

Dependency or boundary: FACT/RUN

Local funder edit does not silently become permanent organization preference. D12B lines1019-1021

Evidence: Not examined in this run; current implementation unknown. Reference: VO06; master line 1456.

Master work or verification: Scope local correction; ask before consequential inferred promotion

Expected check: one-funder style edit stays local

Dependency or boundary: FACT/ID

User can inspect and delete inferred private preferences. D12B

Evidence: Not examined in this run; current implementation unknown. Reference: VO07; master line 1457.

Master work or verification: Bounded preference inspection/removal, not generalized memory UI

Expected check: inspect/delete and future-use test

Dependency or boundary: FACT/ID

Voice reset/replacement affects future proposals by default. I5.3; PG S19

Evidence: Not examined in this run; current implementation unknown. Reference: VO08; master line 1458.

Master work or verification: Exercise reset path and truthful no-learned-voice state

Expected check: next proposal uses reset state

Dependency or boundary: FACT/RUN

Reset does not alter existing drafts; restyling needs separate choice. I5.3; PG S19

Evidence: Not examined in this run; current implementation unknown. Reference: VO09; master line 1459.

Master work or verification: Preserve old draft hash and explicitly invoke restyle

Expected check: before/after hashes

Dependency or boundary: DOC/RUN

Withdrawing sample stops future retrieval/use and reviews derivatives. I5.3; D12C

Evidence: Not examined in this run; current implementation unknown. Reference: VO10; master line 1460.

Master work or verification: Trace sample through cache/retrieval/style artifacts

Expected check: withdrawal canary T18/T23

Dependency or boundary: FACT/ID

Keep voice and shared learning private and trustworthy

Traceability group S07; safeguard.

Scope connection: Cross-tenant isolation, rights/withdrawal, no customer-data model training and valid evaluation constrain voice and shared learning. They are not six independently countable customer features.

Evidence in this group: 1 whole merged; 5 unexamined in this run.

No cross-tenant facts or distinctive voice leakage. D R13/12C/T18

Evidence: Reported whole implementation merged; acceptance remains. Reference: VO11; master line 1461.

Master work or verification: Test voice independently of ordinary row-level isolation

Expected check: two-tenant rare-phrase and reconstruction cases

Dependency or boundary: FACT/ID/RUN

Private retrieval/learning is not customer-data model training; training remains excluded. D12B; PG §2.2

Evidence: Not examined in this run; current implementation unknown. Reference: VO12; master line 1462.

Master work or verification: Trace purposes/data flows and exclude training admission

Expected check: processing/learning evidence, not marketing claim

Dependency or boundary: POLICY/RUN

Shared learning requires purpose/rights/audience/expiry admission, reconstruction review and release approval. D12B-C

Evidence: Not examined in this run; current implementation unknown. Reference: VO13; master line 1463.

Master work or verification: Keep private by default; bounded authorized admission only

Expected check: T18 permission and rare-combination tests

Dependency or boundary: POLICY/FACT/ID

Recheck sharing permission at use; withdrawal propagates to derived material. D12B-C/14B

Evidence: Not examined in this run; current implementation unknown. Reference: VO14; master line 1464.

Master work or verification: Preserve lineage and deny new reuse after withdrawal

Expected check: derivative canary T23

Dependency or boundary: POLICY/FACT/ID

Acceptance/award/popularity are not truth or quality labels. D12B-C

Evidence: Not examined in this run; current implementation unknown. Reference: VO15; master line 1465.

Master work or verification: Separate behavior metrics from support truth; benchmark shortcuts

Expected check: changed/rare-question T18/T19

Dependency or boundary: FACT/RUN

Quality evaluation includes voice fit and human correction burden. Q6; D T19; PG PT21

Evidence: Not examined in this run; current implementation unknown. Reference: VO16; master line 1466.

Master work or verification: Named blinded rubric/fixtures with editing minutes and interventions

Expected check: T19/PT21 artifact with concierge off

Dependency or boundary: RUN

Propose and accept focused AI text changes

Traceability group F47; capability.

Scope connection: One scoped assisted-edit operation with preview, acceptance/rejection and revision-aware undo, shared across editor surfaces.

Evidence in this group: 4 unexamined in this run.

Focused sentence/question edit stays scoped, with affected dependencies only. D §7A; PG S12

Evidence: Not examined in this run; current implementation unknown. Reference: DR26; master line 1388.

Master work or verification: Connect local operation with current selection/revision, no full-app restart

Expected check: local-edit spend/scope trace

Dependency or boundary: DOC/REQ/RUN

Native contextual chat produces proposed local changes. D2B/9C; PG S12

Evidence: Not examined in this run; current implementation unknown. Reference: ED03; master line 1474.

Master work or verification: Connect selection/current text/revision to proposal cards

Expected check: passage chat changes selected region only

Dependency or boundary: DOC/RUN

Users can compare and accept/reject proposed text without silent overwrite. D2B/C; PG S12

Evidence: Not examined in this run; current implementation unknown. Reference: ED06; master line 1477.

Master work or verification: Retest current revision/permissions, not blanket approve of all suggestions

Expected check: accept/reject regression

Dependency or boundary: DOC/ID

Targeted proposal Undo is available after acceptance and is revision-aware. PG V7; D9B

Evidence: Not examined in this run; current implementation unknown. Reference: ED08; master line 1479.

Master work or verification: Connect inverse proposal with conflict/access checks

Expected check: accepted-Undo after concurrent change

Dependency or boundary: DOC/BIND/ID

Searcher and funding discovery

Browse and filter the funding catalog

Traceability group F01; capability.

Scope connection: Organization/program/idea entries, filters and saved views are variants of funding search.

Evidence in this group: 21 unexamined in this run; 1 whole merged.

Complete authorized browse is available independently of recommendations or a client match. F R01/R02, §2B/§9A; G S04; R P01.

Evidence: Not examined in this run; current implementation unknown. Reference: FD001; master line 848.

Master work or verification: Expose retained authorized corpus through existing browse; CAT+ID.

Expected check: No-profile, unmatched, zero-score and unscored fixtures remain reachable (AT02).

Organization-wide discovery is a launch entry point. W Q41; G S04.

Evidence: Not examined in this run; current implementation unknown. Reference: FD013; master line 860.

Master work or verification: Retain current route while widening scopes.

Expected check: Run records organization scope; acceptance still needs release-candidate UI test.

Discovery can target an existing program. W Q41; G §23/Q48.

Evidence: Not examined in this run; current implementation unknown. Reference: FD014; master line 861.

Master work or verification: Add selected program scope over existing run, not second discovery engine.

Expected check: Same org/program fixture yields attributable program-scoped search.

Discovery can explore a new idea. W Q41.

Evidence: Not examined in this run; current implementation unknown. Reference: FD015; master line 862.

Master work or verification: Accept bounded idea text/context with clear tentative status.

Expected check: New-idea search works before a mature program record.

Geography and funding-amount filters combine. W Q41; G S04; F §9A.

Evidence: Not examined in this run; current implementation unknown. Reference: FD016; master line 863.

Master work or verification: Add composable filters to authorized query.

Expected check: Combined geography+amount query matches declared semantics and clears correctly.

Geography reflects service/applicant applicability, not funder headquarters or registered address alone. F R12/§1B; W Q41.

Evidence: Not examined in this run; current implementation unknown. Reference: FD017; master line 864.

Master work or verification: Specify service-area field and unknown handling before filter implementation.

Expected check: Foreign-headquartered US-applicable record included (F T07).

Unknown amount does not automatically hide an otherwise relevant record. W Q41; F T01.

Evidence: Not examined in this run; current implementation unknown. Reference: FD018; master line 865.

Master work or verification: Preserve null independently of zero in query/UI.

Expected check: Unknown-amount fixture remains included by default.

Unknown relevance, missing date and rolling deadlines remain included by default. F §2B/§9A; G S04.

Evidence: Not examined in this run; current implementation unknown. Reference: FD019; master line 866.

Master work or verification: Preserve unknown and rolling buckets in complete browse.

Expected check: No-profile/missing-date/unscored cases survive ingest→browse (T01).

Nearest deadline is default sort; alternate sorts remain available. G V6 supersedes existing default.

Evidence: Not examined in this run; current implementation unknown. Reference: FD020; master line 867.

Master work or verification: Change default, retaining alternatives and truthful unknown groups.

Expected check: Fresh session starts deadline order; user alternate persists per policy.

Relevance ranking and deadline filtering/sorting are independently controllable. F R02/§9C.

Evidence: Not examined in this run; current implementation unknown. Reference: FD021; master line 868.

Master work or verification: Separate query predicates from sort keys.

Expected check: Change sort without losing rows; explicit filters explain removals.

Every filtered view shows effective filters and clear/reset. F §2B/§9A; G S04.

Evidence: Not examined in this run; current implementation unknown. Reference: FD022; master line 869.

Master work or verification: Verify UI first; add missing active-filter indication/reset.

Expected check: Zero-result query is visibly filtered and clear-all restores permitted rows.

Filtered/excluded counts are authorized, distinct-total and per-filter counts clearly distinguished. F §9A.

Evidence: Not examined in this run; current implementation unknown. Reference: FD023; master line 870.

Master work or verification: Add count contract without leaking inaccessible records.

Expected check: Overlapping filters do not double-count total; hidden tenant records absent.

No recommendations can coexist with browse results; absent profile must not force onboarding. G S04; F T01.

Evidence: Not examined in this run; current implementation unknown. Reference: FD024; master line 871.

Master work or verification: Remove sparse-start gate and expose catalog, reuse existing profile.

Expected check: New permitted tenant browses with no profile; no-match view links browse.

Initial comprehensive search follows profile completion without forbidding earlier discovery. W Q48; G S04.

Evidence: Reported whole implementation merged; acceptance remains. Reference: FD025; master line 872.

Master work or verification: Separate explicit/authorized initial search trigger from mere page opening.

Expected check: Completing profile schedules once; earlier allowed browse remains usable.

Named saved filters are available. W Q48; G S04.

Evidence: Not examined in this run; current implementation unknown. Reference: FD028; master line 875.

Master work or verification: Persist named filter definitions with defined person/team scope.

Expected check: Save, sign out/in and reapply same effective query.

Funding taxonomy includes sponsorships, prizes, in-kind, contracts/RFPs, loans, fellowships and other, not only grants. F R07/§4B.

Evidence: Not examined in this run; current implementation unknown. Reference: FD062; master line 921.

Master work or verification: Verify retained instrument fields; add extensible values without promising drafting for every format.

Expected check: Non-grant fixture remains discoverable despite inability to automate its application.

Search browse pagination uses stable fixed cut/query/auth/model versions, rejecting changed cursors. F §9A.

Evidence: Not examined in this run; current implementation unknown. Reference: FD103; master line 962.

Master work or verification: Implement cursor contract on complete browse, not a hidden total-result cap.

Expected check: Page-through concurrent updates has no unexplained omission; changed query restarts.

Relational complete browse survives semantic/index outage with separate index freshness. F §9A; G S04.

Evidence: Not examined in this run; current implementation unknown. Reference: FD104; master line 963.

Master work or verification: Add authoritative browse fallback and distinct index watermark.

Expected check: Newly ingested row visible before index catches up; top-K not full universe.

Shared feed includes all authorized lightweight records regardless of profile/rank/status; bytes may hydrate on demand with truthful availability. F §10A; R §5.

Evidence: Not examined in this run; current implementation unknown. Reference: FD107; master line 972.

Master work or verification: Implement scoped distribution without copying every private document or requiring settled backend placement.

Expected check: Low-ranked/historical/prospect rows reach authorized consumer; unhydrated bytes not called offline-complete.

Launch serves US organizations and US funding opportunities; out-of-scope handling remains open.

Evidence: Not examined in this run; current implementation unknown. Reference: WA08; master line 238.

Master work or verification: State geography scope separately from language; preserve unresolved outside-US behavior.

Expected check: US applicant and domestic opportunity accepted; documentation does not promise global scope or silently infer unsupported foreign handling.

US Mexican American organization and Spanish-language/culture-promotion grant are within scope; source/program/grant language is distinct from English UI.

Evidence: Not examined in this run; current implementation unknown. Reference: WA09; master line 239.

Master work or verification: Add language-sensitive eligibility and translation fixture, not multilingual UI.

Expected check: English UI processes supported Spanish material; grant is not excluded merely for language or cultural program focus.

Search can be rerun as organization information grows so opportunity results reflect richer context.

Evidence: Not examined in this run; current implementation unknown. Reference: WA28; master line 258.

Master work or verification: Connect approved explicit/scheduled refresh to current profile fingerprint; do not infer automatic paid run on every edit.

Expected check: Add program/geography evidence, initiate permitted rerun, and show attributable changed results without stale profile reuse.

Review and save funding leads

Traceability group F02; capability.

Scope connection: Save, pass and optional reasons are states of the same triage capability; each round retains its own choice.

Evidence in this group: 15 unexamined in this run; 1 whole merged.

Plausible candidates survive target-fetch or extraction failure. F §4A/§7A; R P01; G S06.

Evidence: Not examined in this run; current implementation unknown. Reference: FD002; master line 849.

Master work or verification: Connect candidate preservation to visible lead/browse path; M05/M06.

Expected check: Failed URL and malformed extraction retain original lead and knowns (AT01/AT16).

Show promising unverified leads separately with an explicit needs-verification label. G S06; R P01.

Evidence: Not examined in this run; current implementation unknown. Reference: FD003; master line 850.

Master work or verification: Add a distinct lead presentation over existing frontier/research records.

Expected check: Successful scoped read displays lead; read failure is not empty (AT01).

Lead shows discovery date, knowns, unknowns, referring evidence and target link where available. G S06; R P01.

Evidence: Not examined in this run; current implementation unknown. Reference: FD004; master line 851.

Master work or verification: Verify retained discovery fields and connect only missing display/provenance.

Expected check: Missing target link still shows referring evidence; no invented URL/date.

Lead interest choices are Yes, No and Not decided. R P01; G S06.

Evidence: Not examined in this run; current implementation unknown. Reference: FD005; master line 852.

Master work or verification: Wire separate interest state, not factual verification.

Expected check: All three values persist and reload with actor/time/revision.

Lead-decision reason and additional information are optional. R P01 supersedes reason-required behavior.

Evidence: Not examined in this run; current implementation unknown. Reference: FD006; master line 853.

Master work or verification: Remove compulsory reason on this decision path, retaining optional note.

Expected check: No with blank reason succeeds; extra information remains attributable.

Yes records interest without verifying facts, creating an application, drafting or external commitment. R P01; G S06.

Evidence: Reported whole implementation merged; acceptance remains. Reference: FD007; master line 854.

Master work or verification: Preserve distinct interest/pursuit/verification commands.

Expected check: Yes causes only tenant interest change and no paid call/application.

No is reversible and tenant-local, not a global negative label. F §2C; R P01.

Evidence: Not examined in this run; current implementation unknown. Reference: FD008; master line 855.

Master work or verification: Verify local scope and durable undo/history rather than only session undo.

Expected check: Tenant A No leaves B unchanged; reversal survives reload.

A round Pass affects that round only unless user explicitly chooses a broader reversible rule. F §2B/§2C/T19; G V29.

Evidence: Not examined in this run; current implementation unknown. Reference: FD009; master line 856.

Master work or verification: Inspect decision key/scope; add explicit broader-rule path only as required.

Expected check: Prior round stays passed; separate new round remains undecided.

A new round after prior Pass surfaces previous decline and new terms for a fresh choice. G V29 controls later than A target.

Evidence: Not examined in this run; current implementation unknown. Reference: FD010; master line 857.

Master work or verification: Add round identity/history projection without reopening old decision.

Expected check: New-round fixture shows old decline and current terms, no auto-Pursue or reminder enrollment.

Lead additions are authenticated user assertions, not source-verified facts. F §5A; R P01.

Evidence: Not examined in this run; current implementation unknown. Reference: FD011; master line 858.

Master work or verification: Preserve actor, original statement and claim type in M06.

Expected check: User note is visibly attributed; no fabricated target retrieval.

Concurrent interest updates refuse stale overwrites. F §12A; G S06.

Evidence: Not examined in this run; current implementation unknown. Reference: FD012; master line 859.

Master work or verification: Add revision guard to current decision route.

Expected check: Two writers conflict safely and preserve losing input (AT01).

Team opportunity queue has needs-review/pursue/pass/next-cycle states. W Q48.

Evidence: Not examined in this run; current implementation unknown. Reference: FD029; master line 876.

Master work or verification: Map current states to required meanings without inventing approval workflow.

Expected check: Two teammates see consistent queue and reversible decisions.

Team queue supports an owner and short decision note. W Q48.

Evidence: Not examined in this run; current implementation unknown. Reference: FD030; master line 877.

Master work or verification: Verify queue assignment separately from application owner; add minimum fields.

Expected check: Assigned owner/note survive reload and permission changes.

New discovery enters review; never automatically pursues. W Q48; G S04.

Evidence: Not examined in this run; current implementation unknown. Reference: FD031; master line 878.

Master work or verification: Retain as invariant across new sources and schedules.

Expected check: Scheduled discovery creates review rows only, no application or draft.

Save/unsave records interest without creating an application or metered drafting. G §2.1/S04.

Evidence: Not examined in this run; current implementation unknown. Reference: LC001; master line 1063.

Master work or verification: Retain while adding intake/lead routes; verify unsave semantics.

Expected check: Save produces no draft/application/charge, including retry.

New round after prior Pass requires fresh decision with prior decline and new terms visible. PG V29, PT03

Evidence: Not examined in this run; current implementation unknown. Reference: LC19; master line 1786.

Master work or verification: Keep distinct round identity/history; respect only explicitly chosen broader reversible dismissal.

Expected check: Pass old round, add new terms: new round appears without auto-Pass, auto-Pursue or rewriting old history.

Dependency or boundary: REQ/FACT/ID

Assess fit and tailor matching preferences

Traceability group F03; capability.

Scope connection: Evidence-based fit, eligibility and adjustable recommendation preferences serve one assessment goal.

Evidence in this group: 12 unexamined in this run.

Card separates mission/fit, funding, effort and eligibility assessments. W Q42; A X17 target.

Evidence: Not examined in this run; current implementation unknown. Reference: FD033; master line 880.

Master work or verification: Connect separate sourced dimensions; visual bars/stars are not a fixed requirement.

Expected check: Unknown eligibility does not become low fit score or award probability.

Cards show purpose, amount/basis, eligibility, location, deadline, history, burden and relationship route where known. W Q42; G S05.

Evidence: Not examined in this run; current implementation unknown. Reference: FD034; master line 881.

Master work or verification: Audit existing card fields against typed data; expose gaps without fabrication.

Expected check: Fixture with each field and sparse fixture both render truthful provenance.

Incomplete/ambiguous eligibility prompts human review, not automatic exclusion. W Q43; R AT03.

Evidence: Not examined in this run; current implementation unknown. Reference: FD035; master line 882.

Master work or verification: Ensure explicit disqualification remains visible warning/filter, not silent catalog loss.

Expected check: Unknown and explicit-conflict fixtures remain authorized browseable with exact criteria.

Exact unmet funder criterion and source are shown; user can correct data, contact funder or proceed. W Q43.

Evidence: Not examined in this run; current implementation unknown. Reference: FD036; master line 883.

Master work or verification: Add explanation and allowed next actions, without falsely waiving rules.

Expected check: Criterion passage shown; correction reruns assessment and preserves history.

Opportunity shows source link, first-found, last-successful-check, known publication date and refresh history separately. W Q44; G S05.

Evidence: Not examined in this run; current implementation unknown. Reference: FD037; master line 884.

Master work or verification: Expose distinct dates and success history over observation model.

Expected check: Old filing fetched today retains old publication period; failure leaves success date unchanged.

Expired, rolling, invitation-only and unconfirmed are distinct; expired cycles may remain labeled leads. W Q44; F §4B/§9C.

Evidence: Not examined in this run; current implementation unknown. Reference: FD038; master line 885.

Master work or verification: Complete distinct availability/access/freshness display.

Expected check: No invented deadline; old cycle visible as historical, not an open round.

User can change recommendation exclusions, location, amount, project type, burden and strategy. W Q45.

Evidence: Not examined in this run; current implementation unknown. Reference: FD039; master line 886.

Master work or verification: Verify existing preference settings; add missing bounded dimensions.

Expected check: Each preference changes explanation/query and leaves factual claims unchanged.

Preference changes name opportunity/program/org scope and can be undone; broader change visibly rescores. W Q45.

Evidence: Not examined in this run; current implementation unknown. Reference: FD040; master line 887.

Master work or verification: Persist scoped preference revisions and visible recalculation.

Expected check: One-off dismissal does not silently change organization strategy.

Show appears-eligible-now versus potential-needing-information with exact unresolved conditions; identify common gaps across opportunities where one supported correction may address several. W Q47.

Evidence: Not examined in this run; current implementation unknown. Reference: FD044; master line 891.

Master work or verification: Use evidence-backed groups without treating document upload as eligibility guarantee.

Expected check: Missing W-9/990 is not automatically ineligible; shared gaps link affected opportunities.

Local ranking keeps private profiles tenant-scoped and explains evidence/coverage without win probabilities. F §9B; W Q42.

Evidence: Not examined in this run; current implementation unknown. Reference: FD105; master line 964.

Master work or verification: Record score/profile versions and factors; keep sparse features unassessed.

Expected check: Missing features never fabricate precision or transmit private profiles publicly.

Profile changes rescore but never silently untrack records; no-click/popularity cannot narrow public discovery. F §9B/T19.

Evidence: Not examined in this run; current implementation unknown. Reference: FD106; master line 965.

Master work or verification: Separate tenant preferences from corpus membership.

Expected check: Profile edit preserves tracked record; obscure unclicked candidate stays visible.

Capacity/resource concerns use explicit evidence, identify unknowns and offer more information, reduced scope or partners; do not invent incapacity or veto exploring/applying solely from the model's judgment.

Evidence: Not examined in this run; current implementation unknown. Reference: AW13; master line 348.

Master work or verification: Add a capacity-concern fixture to existing planning/eligibility work; show staffing/budget/facility/experience evidence and bounded options. Later V13 still governs an actual unmet funder requirement blocking Ready; this row must not weaken that requirement.

Expected check: Incomplete staffing yields a question and visible gap, not fabricated incapacity. A supported concern offers explainable options and preserves exploration. A genuine unmet mandatory funder condition remains a separate Ready block under V13.

Investigate opportunities and recover sparse results

Traceability group F04; capability.

Scope connection: Research, route recommendations and sparse-results suggestions support deciding what to pursue.

Evidence in this group: 8 unexamined in this run.

Next-step route derives from actual funder instructions with exact supporting link/text. W Q46.

Evidence: Not examined in this run; current implementation unknown. Reference: FD041; master line 888.

Master work or verification: Use M06 claims to render application/LOI/contact/meeting/next-cycle route.

Expected check: Unknown route says unconfirmed and links funder; no guessed application route.

Required contact is distinguished from suggested introduction. W Q46.

Evidence: Not examined in this run; current implementation unknown. Reference: FD042; master line 889.

Master work or verification: Add source-backed required-vs-suggested labeling.

Expected check: Suggested intro never blocks application or becomes funder requirement.

Sparse results explain constraints and real source gaps; never pad with unrelated opportunities. W Q47; G S04.

Evidence: Not examined in this run; current implementation unknown. Reference: FD043; master line 890.

Master work or verification: Add bounded explanation using filters/coverage; request permission before broadening.

Expected check: Sparse fixture explains exclusions; no unrelated defense contracts for education case.

Contextual opportunity discussion and deeper research are available without inventing facts. W Q42 direction; R bounded research.

Evidence: Not examined in this run; current implementation unknown. Reference: FD045; master line 892.

Master work or verification: Verify existing assistant scope; preserve provenance and optional paid start.

Expected check: User asks why-fit and gets attributable dimensions with unknowns.

Apply an evidence threshold appropriate to the proposed action: a credible lead may be shown with labeled gaps, but recommending application requires current requirements checked; unresolved relationship route may justify a suggested inquiry rather than an application recommendation. Q42, DEC507; WB537; recorded acceptance “Uh, yeah, we can, we'll refine that more, but largely, yeah.”

Evidence: Not examined in this run; current implementation unknown. Reference: FD135; master line 307.

Master work or verification: Carry evidence state into the proposed next action, without inventing numeric confidence thresholds, hiding leads or automatically contacting anyone.

Expected check: Same incomplete candidate remains a labeled lead; recommendation does not claim checked requirements. After successful current requirement check, application recommendation can be justified. Unknown relationship route produces a clearly optional, grounded inquiry suggestion, not a fabricated application route.

For sparse or invitation-only/recurring sources, explain knowns/unknowns and suggest concrete next research/contact steps with the funder link. Q44, DEC511; WB558; acceptance “Yeah, exactly”.

Evidence: Not examined in this run; current implementation unknown. Reference: FD136; master line 308.

Master work or verification: Add source-grounded next-step help to the existing opportunity/lead view; distinguish suggestion from required contact.

Expected check: Invitation-only record with no public form links the funder, states unavailable information and suggests checking official site or asking program staff. No automatic outreach; recurrence never becomes proof a new round is open.

In sparse-result recovery, suggest relevant program adjustments for consideration, rather than merely explain few results. Q47, DEC517; WB586; clarified acceptance “Yeah, works exactly”.

Evidence: Not examined in this run; current implementation unknown. Reference: FD137; master line 309.

Master work or verification: Extend sparse-result help with bounded, clearly proposed changes tied to actual funding criteria; do not adopt a new program automatically.

Expected check: Sparse education-program fixture yields relevant adjustments with source rationale; rejected suggestion changes neither program nor search preferences and never produces unrelated defense contracts to pad results.

In sparse-result recovery, ask whether the user knows relevant funders and use the supplied lead to continue investigation. Q47, DEC517; WB586.

Evidence: Not examined in this run; current implementation unknown. Reference: FD138; master line 310.

Master work or verification: Add a bounded input to the existing discovery/research path, attributed to the user; not a new contact database or automatic communication.

Expected check: Known-funder answer creates/reuses an attributable candidate, checks duplicate identity and preserves uncertainty. No answer leaves browsing usable; no message is sent to the funder.

Add an opportunity from supplied material

Traceability group F05; capability.

Scope connection: Manual, URL, uploaded file and saved email are intake variants, not separate capabilities.

Evidence in this group: 8 unexamined in this run; 2 whole merged.

User-added manual opportunity enters the same preparation/drafting workflow. W Q49; G V16/S04.

Evidence: Not examined in this run; current implementation unknown. Reference: FD046; master line 899.

Master work or verification: Expose existing creation flow with source attribution.

Expected check: Manual item reaches same preparation, question intake and review.

Link intake can create an opportunity with accessible-source parsing. W Q49; G V16.

Evidence: Not examined in this run; current implementation unknown. Reference: FD047; master line 900.

Master work or verification: Add link intake to candidate→review→Pursue flow.

Expected check: Accessible link yields cited facts; blocked link retains candidate and gaps.

Uploaded document can create an opportunity. W Q49; G V16.

Evidence: Not examined in this run; current implementation unknown. Reference: FD048; master line 901.

Master work or verification: Route upload extraction into same candidate/claim model.

Expected check: PDF/Word source preserved; extraction gap not false completion.

Saved email can create an opportunity. W Q49.

Evidence: Not examined in this run; current implementation unknown. Reference: FD049; master line 902.

Master work or verification: Reuse permitted parsing, connect candidate intake without automatic mailbox access.

Expected check: Saved email becomes attributed opportunity; private contents remain tenant-private.

Duplicate opportunity checks preserve source provenance and expose conflicts. W Q49; G S04.

Evidence: Not examined in this run; current implementation unknown. Reference: FD050; master line 903.

Master work or verification: Match identities/cycles cautiously; show existing record and new evidence.

Expected check: Duplicate link/upload adds evidence without duplicate pursuit or silent overwrite.

Added opportunity missing requirements prompts gaps, including unknown response format, rather than inventing questions/limits. W Q49/Q50 partial; G S10.

Evidence: Reported whole implementation merged; acceptance remains. Reference: FD051; master line 904.

Master work or verification: Mark preparation-only placeholders; collect actual questions with confirmation.

Expected check: Unknown form remains incomplete; user upload/manual actual questions adopted.

Added opportunity does not automatically start drafting. G V16/S04; D §13A.

Evidence: Reported whole implementation merged; acceptance remains. Reference: FD052; master line 905.

Master work or verification: Decouple create/Pursue and Start draft.

Expected check: Add and pursue incur no drafting charge; explicit Start required.

Historical imports preserve original/date/owner/batch/hash, support reviewed mapping and duplicate lineage. F §12B.

Evidence: Not examined in this run; current implementation unknown. Reference: FD119; master line 984.

Master work or verification: Reuse file intake with explicit historical claims and dedup review.

Expected check: Old budget stays historical unless applicable dated confirmation; duplicate awards not inflated (T12).

Invitation-specific supplied requirements take precedence over generic listings for that invitation; substantive conflict still requires clarification rather than blind acceptance or overwrite. Q49, DEC529-532; same-workflow acceptance at DEC531: “a hundred percent, they shouldn't be treated any different”; invitation precedence is the recorded decision summary, not that quote's literal wording.

Evidence: Not examined in this run; current implementation unknown. Reference: FD139; master line 311.

Master work or verification: Bind supplied invitation to recipient/cycle/track and retain both sources with a scoped authority/clarification record; public generic projection must not be overwritten by tenant invitation.

Expected check: Invitation says different deadline or format from general page: show both, identify invitation scope and clarify unresolved conflict. Confirmed applicable private terms drive only that preparation; generic public listing and other tenants remain unchanged.

Supplement user-added opportunities with available relevant public information while retaining the supplied source and unresolved gaps. Q49, DEC529.

Evidence: Not examined in this run; current implementation unknown. Reference: FD140; master line 312.

Master work or verification: Reuse existing permitted public research routes after identity/cycle check; supplement, never silently replace invitation-specific material.

Expected check: Sparse manual opportunity gains attributable public facts for the same cycle; unavailable research leaves original candidate and known gaps intact; a different round is not merged.

Watch funders and refresh discovery

Traceability group F06; capability.

Scope connection: User-chosen refresh and watching newly discovered rounds share a monitoring goal.

Evidence in this group: 5 unexamined in this run.

Customer chooses background refresh cadence. W Q48; G S04/S22.

Evidence: Not examined in this run; current implementation unknown. Reference: FD026; master line 873.

Master work or verification: Add org schedule/preferences over existing run.

Expected check: User schedule persists; job fires once at configured time.

Deduplicate scheduled search organization-wide, not per grantwriter. W Q48.

Evidence: Not examined in this run; current implementation unknown. Reference: FD027; master line 874.

Master work or verification: Reuse concurrency guard; add durable schedule dedup/idempotency.

Expected check: Multiple users/settings retries create one org job per scheduled occurrence.

Refresh scheduling has truthful overdue/failure status; customer demand cannot erase baseline inventory. F §7C; G S04.

Evidence: Not examined in this run; current implementation unknown. Reference: FD102; master line 961.

Master work or verification: Add scheduler/outcome ledger, source-policy constraints and visible backlog.

Expected check: Overdue source never reports current; budget deferral preserves queued candidates.

Watching a funder or funding program includes newly discovered rounds. Funding specification §2B, lines 207-208; T19.

Evidence: Not examined in this run; current implementation unknown. Reference: FD141; master line 356.

Master work or verification: Preserve watch scope separately from round decisions and connect newly discovered rounds to it.

Expected check: Watch a funder, dismiss one round, then ingest another: the new round appears for review without auto-Pursue or copying the dismissal.

Manual refresh shows queued, running, completed, blocked or failed; a request does not itself mean verified. Funding specification §2B, line 213.

Evidence: Not examined in this run; current implementation unknown. Reference: FD142; master line 357.

Master work or verification: Connect refresh to truthful job/result state and the successful observation date.

Expected check: Exercise each state; failed, blocked or pending refresh never advances last-successful-verification date.

Propose corrections to public funding data

Traceability group F20; capability.

Scope connection: Permissioned reviewed contribution distinct from private edits.

Evidence in this group: 2 unexamined in this run.

Public corrections are deliberate permissioned contributions reviewed before canonical publication. F §11/§12B; R §5.2.

Evidence: Not examined in this run; current implementation unknown. Reference: FD117; master line 982.

Master work or verification: Separate local fact, company-only share and public promotion.

Expected check: Private invitation never public by user interest or tenant-count threshold (AT19).

Review overload cannot hide candidates; local user pursuit can continue while public review pending. F §11; R P01.

Evidence: Not examined in this run; current implementation unknown. Reference: FD118; master line 983.

Master work or verification: Queue is review workflow, not catalog visibility gate.

Expected check: Pending conflict remains visible; permitted warned handoff works.

Trustworthy source evidence and funding identity

Traceability group S01; safeguard.

Scope connection: Identity, typed facts, dates, evidence provenance, conflicts and corrections support discovery rather than independent user features.

Evidence in this group: 32 unexamined in this run.

Stable source/entity identities survive changing URLs/titles; distinct annual cycles get distinct identity. Title similarity alone cannot merge rounds, missing amount/deadline alone cannot reject identity, and ambiguous matches remain candidates. F §4A/§8; R §8.

Evidence: Not examined in this run; current implementation unknown. Reference: FD061; master line 920.

Master work or verification: Map existing grant keys before additive aliases/cycle identities.

Expected check: Reused annual URL yields two rounds; changed URL retains the same supported round; same-title different rounds and missing-field same-round sources remain correctly resolved.

Funders, continuing programs, rounds, prospects, past awards, payments and inferred forecasts retain distinct meanings. F §4A; R §6.

Evidence: Not examined in this run; current implementation unknown. Reference: FD063; master line 922.

Master work or verification: Add typed identity/projection rather than one ambiguous state.

Expected check: Historical award never displays as open call; inferred future cycle stays forecast (T06).

Availability, access route, evidence freshness, conflict, customer decision and sync health are independent. F §4B; R §6.

Evidence: Not examined in this run; current implementation unknown. Reference: FD064; master line 923.

Master work or verification: Separate fields in projection and UI.

Expected check: Open invitation-required track can be stale and locally passed without conflation.

Amount retains decimal, currency, min/max, original wording and per-award/pool/year/multiyear/payment basis. F §4B; G S05.

Evidence: Not examined in this run; current implementation unknown. Reference: FD065; master line 924.

Master work or verification: Confirm typed amount representation then connect renderer.

Expected check: Pool total never shown as individual award; null differs from zero (AT06).

Match, reimbursement, eligible-expense and indirect-cost restrictions remain sourced. F §4B.

Evidence: Not examined in this run; current implementation unknown. Reference: FD066; master line 925.

Master work or verification: Add restriction claim types only missing from existing data.

Expected check: Each displayed restriction points to correct round/source passage.

Award totals and disbursement payments are not double-counted. F §4B/§15D.

Evidence: Not examined in this run; current implementation unknown. Reference: FD067; master line 926.

Master work or verification: Preserve parent award/payment relation and unresolved links.

Expected check: Multiyear total plus annual payments yields one commitment total.

Observations record success, unchanged, failure, discovery and manual assertion distinctly. F §5A; R §6.

Evidence: Not examined in this run; current implementation unknown. Reference: FD068; master line 927.

Master work or verification: Extend existing records with typed observation and attempt outcomes.

Expected check: Failure has no fabricated capture; discovery assertion has no retrieval timestamp.

Successful and unchanged checks link immutable captured bytes/hash; failed fetch never fabricates content. F §5A.

Evidence: Not examined in this run; current implementation unknown. Reference: FD069; master line 928.

Master work or verification: Verify existing snapshots and capture immutability before extending.

Expected check: 304 links retained body; new bytes create new capture; failed read keeps last good.

Acquisition provenance retains requested/final URL, redirects, status, deployment/run, validators, MIME and timestamps. F §5A.

Evidence: Not examined in this run; current implementation unknown. Reference: FD070; master line 929.

Master work or verification: Map existing fetch ledger columns and fill missing provenance.

Expected check: Capture can be traced to exact attempt and original source without private token leakage.

Claim preserves typed value, raw text, evidence coordinates, applicable period, extraction identity and review state. F §5A; R §6.

Evidence: Not examined in this run; current implementation unknown. Reference: FD071; master line 930.

Master work or verification: Add immutable claims and exact anchors reusing existing tables where sound.

Expected check: Quote-valid/wrong-program and wrong-amount-basis claims fail validation; a shared 40-character prefix alone cannot establish the full quote anchor (AT06).

Publication/applicability/retrieval dates remain separate. F §5A; W Q44.

Evidence: Not examined in this run; current implementation unknown. Reference: FD072; master line 931.

Master work or verification: Distinct dated fields and labels.

Expected check: 2022 filing fetched now does not become current policy evidence.

Resolution retains competing claims, selected evidence, reason/rule version and current immutable projection. F §5B; R §6.

Evidence: Not examined in this run; current implementation unknown. Reference: FD073; master line 932.

Master work or verification: Add scoped resolutions and projection atop immutable claims.

Expected check: Two credible deadlines coexist; no unique-current-claim constraint discards competing evidence, and expected-revision protection prevents concurrent resolution overwrite (AT04).

Evidence resolution uses authority, applicable period and specificity, not arrival count or confidence alone. F §5B; R P02.

Evidence: Not examined in this run; current implementation unknown. Reference: FD074; master line 933.

Master work or verification: Implement/test explicit resolver precedence.

Expected check: Current amendment outranks old generic page; syndicated copies do not outvote original.

Routine funder facts can publish source-supported after independent source/type/round/conflict validation. R P02 controls blanket human gate.

Evidence: Not examined in this run; current implementation unknown. Reference: FD075; master line 934.

Master work or verification: Reuse validated parsers; gate route release on field tests, not universal admin click.

Expected check: Routine valid fact publishes; wrong-round/conflicted fact stays reviewable (AT07).

Model output never self-certifies; provisional, source-supported, human-reviewed, stale and conflicted labels differ. R P02; G S05.

Evidence: Not examined in this run; current implementation unknown. Reference: FD076; master line 935.

Master work or verification: Add typed status projection and render contracts.

Expected check: Model assertion alone never renders human-reviewed/confirmed (AT07/AT27).

A missing/disappeared field stays last-known/stale while unrelated fields can refresh. R §6/AT08.

Evidence: Not examined in this run; current implementation unknown. Reference: FD077; master line 936.

Master work or verification: Record field observations/disappearance rather than record-wide freshness.

Expected check: Fresh amount plus absent deadline does not renew deadline verification.

LOI, nomination, full-application and prerequisite milestones retain distinct scope and values. F §4A/§9C; D §13B.

Evidence: Not examined in this run; current implementation unknown. Reference: FD078; master line 937.

Master work or verification: Add milestone type/track/prerequisite records.

Expected check: Later full deadline does not overwrite required LOI (AT05/T08).

Raw date wording, precision, local time and published timezone are preserved without assumed midnight. F §4B/§9C; W Q44.

Evidence: Not examined in this run; current implementation unknown. Reference: FD079; master line 938.

Master work or verification: Add typed date contract and truthful rendering/calculation.

Expected check: Date-only/unknown zone never shows exact remaining hours or invented midnight.

Recurring/applicant-relative rules compute dates only with supported rule, anchor and timezone. F §4B.

Evidence: Not examined in this run; current implementation unknown. Reference: FD080; master line 939.

Master work or verification: Preserve unresolved source rule; calculate only resolved supported instances.

Expected check: Unknown anchor stays unresolved; quarterly cutoff is not rolling.

Urgency uses next required unsatisfied milestone for selected applicant track. F §9C.

Evidence: Not examined in this run; current implementation unknown. Reference: FD081; master line 940.

Master work or verification: Calculate from milestone/prerequisite records.

Expected check: Passed LOI shows issue unless completion/waiver recorded with actor/evidence.

Conflicting deadlines remain visible; default high-recall filter includes any credible matching date. F §5B/§9C.

Evidence: Not examined in this run; current implementation unknown. Reference: FD082; master line 941.

Master work or verification: Retain alternatives and conflict-aware query.

Expected check: One matching alternative includes record but no single confirmed badge.

Track closure requires supported evidence/time rule; source outage never closes funding. One closed track or passed LOI does not close other viable or unknown tracks; unknown time zone cannot prove closure, and forecast promotion preserves linked history. F §8; G S05.

Evidence: Not examined in this run; current implementation unknown. Reference: FD083; master line 942.

Master work or verification: Separate resource health/round availability and disclosed temporal rules.

Expected check: 404/login/timeout does not withdraw; passed LOI does not close other tracks; unknown time zone cannot establish closure; forecast-to-announced promotion retains linked history (T03/T08).

Identity merges preserve all applications, aliases, private notes and handoffs. F §8; R §8/AT12.

Evidence: Not examined in this run; current implementation unknown. Reference: FD084; master line 943.

Master work or verification: Replace constraint with pursuit slot + attempts before merge rollout.

Expected check: Two active app identities survive merged grant IDs with explicit resume choice.

False-merge split preserves history and sends ambiguous private associations to repair, not copied pursuit decisions. F §8; R AT15.

Evidence: Not examined in this run; current implementation unknown. Reference: FD085; master line 944.

Master work or verification: Explicit mapping/repair records over stable application identities.

Expected check: Notes survive split; neither child silently inherits pursuit.

High-impact source changes produce immutable before/after history, evidence and actor/resolver reason. F §5C; R §6.

Evidence: Not examined in this run; current implementation unknown. Reference: FD126; master line 997.

Master work or verification: Add material-change history to factual owner, not merely app-stage log.

Expected check: Changed/withdrawn/retracted source preserves old retained substantiation.

Suspicious empty/bulk-loss extraction alerts rather than deleting last-good inventory. F §5C/§7A; R AT16.

Evidence: Not examined in this run; current implementation unknown. Reference: FD127; master line 998.

Master work or verification: Add source-shape anomaly guard with configurable thresholds, not fixed user policy.

Expected check: Empty-after-nonzero run retains old facts and new candidate/capture evidence.

Protected evidence remains while retained decisions depend on it, subject to actual rights/retention. R §4/§11.2/AT30 supersedes last-three cutoff.

Evidence: Not examined in this run; current implementation unknown. Reference: FD128; master line 999.

Master work or verification: Track dependency/rights before garbage collection; legal owner sets periods.

Expected check: Old accepted claim source remains inspectable beyond three newer captures where permitted.

Funder identity/EIN is optional; funder program and applicant delivery program remain distinct. F §4A; R §8.1.

Evidence: Not examined in this run; current implementation unknown. Reference: FD129; master line 1000.

Master work or verification: Map existing identity records and preserve typed unresolved references.

Expected check: No-EIN corporate/public funder and unresolved parent remain represented.

Recover usable 990-PF application guidance as dated source evidence, not a current call. JR §13 Phase 3; J p17 Route D; F §§5/6B.

Evidence: Not examined in this run; current implementation unknown. Reference: PA03; master line 144.

Master work or verification: Verify existing parser; extract useful application/contact/deadline wording with return/filing period and exact evidence location. Backfill retained permitted filings where needed. Do not convert historical text into a current deadline/open round.

Expected check: Known filing fixture yields its verbatim application guidance and period. Blank/absent preselected field stays unknown, not open. Old May 1 text does not become this year's deadline; current corroboration is separately sourced.

Resolve funder websites and recheck known sources with identity and access evidence. JR §§9/13 Phase 3; J p17 Route C.

Evidence: Not examined in this run; current implementation unknown. Reference: PA04; master line 145.

Master work or verification: Reuse stated official sites first; verify any search-derived site belongs to the funder, record resolution basis and source rights, and queue permitted checks. Specific search provider, query count and cost are not mandated.

Expected check: Similarly named funders do not inherit one another's site. Unknown site remains a prospect; valid source receives recorded identity basis and bounded recheck. Missing paid search configuration does not erase the candidate.

Test every factual discovery UI template against its typed evidence basis; remove reproduced seed/demo assertions from live paths. JR §4 Keep and §13 Phase 1; AT27; J pp6/11-14.

Evidence: Not examined in this run; current implementation unknown. Reference: PA07; master line 148.

Master work or verification: Inventory actual discovery card/calendar/sentence templates and trace source basis. Remove or clearly isolate demonstrator content only if reproduced; preserve useful existing UI.

Expected check: Each template has a valid source/type/period/round fixture and an unsupported case that cannot render as a fact. No invented grant history, verification label, open state or seed figure in customer output.

Build minimal additive observation/claim/resolution foundation before exposing source-supported fields, then extend it to shared registry and enable dependent routes. JR §§13 Phase 1-2; AT04-08/AT31.

Evidence: Not examined in this run; current implementation unknown. Reference: PA10; master line 151.

Master work or verification: Reuse existing owners; add only missing structures and versioned resolution/current projection. Backfill legacy rows as legacy/unverified unless evidence supports more. Do not create a temporary incompatible second claim system.

Expected check: Competing claims coexist; wrong round/field is rejected; migration preserves IDs/applications/private overlays and is replayable. No route depends on tables not yet created; no migration alone upgrades old assertions to verified facts.

Source coverage and acquisition

Traceability group S02; safeguard.

Scope connection: Source engines, corpus breadth, extraction and access handling are enabling coverage contracts.

Evidence in this group: 18 unexamined in this run.

Broad coverage includes federal/state/local/tribal/corporate/foundation and authorized private history. F §6A; G V16; R §12.

Evidence: Not examined in this run; current implementation unknown. Reference: FD086; master line 945.

Master work or verification: Connect existing legs first, add measured source gaps under declared source set.

Expected check: Independently found local/private and corporate opportunity, not only supplied URL (AT29).

Preserve funders without websites and dated inactive/closed foundation history. F §6B.

Evidence: Not examined in this run; current implementation unknown. Reference: FD087; master line 946.

Master work or verification: Repair corpus refresh and expose filing-based prospects.

Expected check: No-website foundation remains prospect with historical source period.

Registry presence is not proof of active grantmaking; future payments are commitments, not announced calls. F §6B.

Evidence: Not examined in this run; current implementation unknown. Reference: FD088; master line 947.

Master work or verification: Typed filing claims + render validation.

Expected check: Registry-only record never advertises an open round or current budget.

Invitation-required needs affirmative scoped evidence; no-public-route-found is different. F §6B; W Q44.

Evidence: Not examined in this run; current implementation unknown. Reference: FD089; master line 948.

Master work or verification: Verify source/period/scope and absent-checkbox handling.

Expected check: Missing 990-PF flag never proves open application route.

Source coverage ledger distinguishes searched, failed, not-searched, missing filings, history depth and inaccessible sources. F §1B/§6C; G V16.

Evidence: Not examined in this run; current implementation unknown. Reference: FD090; master line 949.

Master work or verification: Render strip/ledger from current source runs and explicit gaps.

Expected check: Failed search not shown complete; no universal-coverage claim.

Source inventory reconciles full enumeration, pagination, caps, partitions and duplicates. F §6C; R AT16.

Evidence: Not examined in this run; current implementation unknown. Reference: FD091; master line 950.

Master work or verification: Add enumeration ledger and supported complete source strategy.

Expected check: More than each cap/page limit accounted for; interrupted run visibly partial (T02).

Discovery frontier persists before extraction/ranking and survives crashes. F §7A; R AT16/17.

Evidence: Not examined in this run; current implementation unknown. Reference: FD092; master line 951.

Master work or verification: Verify current ledger and make persistence ordering explicit.

Expected check: Crash before extraction loses no plausible candidate.

URLs retain identity-bearing queries and redirect provenance; acquisition follows permitted linked guidelines/attachments. F §7A.

Evidence: Not examined in this run; current implementation unknown. Reference: FD093; master line 952.

Master work or verification: Test current fetcher against round-specific URLs and source policies.

Expected check: Tracking removal does not collapse distinct rounds or private tokens into public metadata.

HTTP 200 login/error/empty shell is failure/blocked, not verified source success. F §7A/T03.

Evidence: Not examined in this run; current implementation unknown. Reference: FD094; master line 953.

Master work or verification: Add source-specific success predicate where missing.

Expected check: Synthetic 200 login preserves last-good facts and failure state.

Every attachment has independent identity/hash/schedule and detects replacement even if parent unchanged. F §7A/T04; R AT10.

Evidence: Not examined in this run; current implementation unknown. Reference: FD095; master line 954.

Master work or verification: Add independent attachment observation/check schedule.

Expected check: Same-URL changed PDF creates new capture and impact with both versions retained.

Conditional checks and periodic full-body checks are distinct and do not perpetually defer body verification. F §7A; R AT09.

Evidence: Not examined in this run; current implementation unknown. Reference: FD096; master line 955.

Master work or verification: Track validator/body/field times separately.

Expected check: Repeated 304 does not prevent required full-body read.

Document extraction preserves original bytes/page coordinates and reports partial/OCR missing pages honestly. F §7A; R AT11.

Evidence: Not examined in this run; current implementation unknown. Reference: FD097; master line 956.

Master work or verification: Reuse bounded parsers and emit completeness metadata.

Expected check: Encrypted/oversized/scanned/partial input remains honest, candidate retained.

Invalid model extraction is rejected without dropping candidate or raw evidence. F §7A; R AT06/07.

Evidence: Not examined in this run; current implementation unknown. Reference: FD098; master line 957.

Master work or verification: Strict typed extractor validation plus replay from captures.

Expected check: Malformed JSON/unsupported value stays gap; parser fix reprocesses same candidate.

Source-denied access remains visibly blocked with bounded backoff and no bypass/aggressive retries. F §7B.

Evidence: Not examined in this run; current implementation unknown. Reference: FD100; master line 959.

Master work or verification: Implement or verify retry/blocked-state policy over existing guarded fetcher.

Expected check: Denial creates reviewable gap, not CAPTCHA/authentication bypass.

Host throttles/quotas isolate bad hosts and preserve urgent plus long-tail discovery capacity. F §7B/§7C; R AT18.

Evidence: Not examined in this run; current implementation unknown. Reference: FD101; master line 960.

Master work or verification: Bound per-domain queues; numeric allocations remain proposed operating defaults.

Expected check: Broken host cannot starve eligible urgent/obscure-source work.

Acquire authorized available source history without a silent year cutoff and disclose source-specific historical limits. Funding specification §1B, lines 150-151; R03.

Evidence: Not examined in this run; current implementation unknown. Reference: FD143; master line 358.

Master work or verification: Preserve accessible historical acquisition within source rights and operational bounds; disclose unavailable or deferred depth.

Expected check: Older available records survive enumeration with historical labels; licensing or access limits are disclosed.

Maintain a real, refreshable source corpus, not a manually uploaded historical snapshot. F R01/R03/R04, §6B; JR §§9/13 Phase 3.

Evidence: Not examined in this run; current implementation unknown. Reference: PA01; master line 142.

Master work or verification: Pin actual Pharos refresh path and storage owner; verify federal and IRS/organization/recipient update coverage. Repair only absent/broken selected refresh steps; preserve lineage and last-good inventory. Make reported corpus size/coverage honest.

Expected check: Controlled refreshed filing/recipient enters corpus, retains period/source, and becomes reachable downstream. Failed or partial refresh preserves prior inventory, records unresolved coverage, and cannot claim complete/current. Corpus counts reconcile to actual retained unique rows.

Use payment/peer graph as one evidence-backed prioritization route, never the complete eligible funder universe. JR §4 “Adapt” and §9; F §6B.

Evidence: Not examined in this run; current implementation unknown. Reference: PA02; master line 143.

Master work or verification: Reuse sound payments and peer matching. Record contributing payment evidence and actual filing coverage. Keep national/out-of-state, new organizations, small awards, intermediary and corporate routes independently discoverable. Exact numeric peer cutoffs remain tunable technical proposals.

Expected check: Fixture outside each peer heuristic is still discoverable by another supported route. A peer result cites actual payment lines and periods and says “in the filings held”; it cannot imply a current invitation, amount or eligibility.

Reliable source processing and distribution

Traceability group S03; safeguard.

Scope connection: Durable jobs, private/public isolation and feed/checkpoint repair enable the existing funding catalog.

Evidence in this group: 11 unexamined in this run; 1 whole merged.

Jobs have durable identity, version, lease/fencing and idempotent completion before acknowledgment. F §7B; R AT17.

Evidence: Not examined in this run; current implementation unknown. Reference: FD099; master line 958.

Master work or verification: Verify discovery queue separately; reuse established job primitives.

Expected check: Duplicate delivery/stale completion/crash cause one durable effect.

Public updates never overwrite private notes, invitations, decisions, internal dates or uploads. F §10A; R §5.2.

Evidence: Not examined in this run; current implementation unknown. Reference: FD108; master line 973.

Master work or verification: Define separate overlay ownership and mutation boundary.

Expected check: Sync/merge/withdrawal preserves private records and identity (AT22).

Entity revision and outbox publication commit together, with stable event identity and sealed stream ordering. F §10B.

Evidence: Not examined in this run; current implementation unknown. Reference: FD109; master line 974.

Master work or verification: Add transactional outbox within existing One API/Postgres before distribution.

Expected check: Commit/dispatch crash loses no event; out-of-order transaction cannot advertise premature head.

Snapshot uses a consistent cut and authenticated count/hash manifest before atomic activation. F §10C.

Evidence: Not examined in this run; current implementation unknown. Reference: FD110; master line 975.

Master work or verification: Build snapshot job/staging/manifest activation, preserving private tables.

Expected check: Corrupt/incomplete partition never marked ready; retry resumes same cut (T10).

Feed consumption commits idempotent apply/inbox receipt/checkpoint together; acknowledges only after commit. F §10C.

Evidence: Not examined in this run; current implementation unknown. Reference: FD111; master line 976.

Master work or verification: Add local receipt/projection/checkpoint transaction.

Expected check: Duplicate/older events are safe no-ops; crash replay does not regress data.

Missing/out-of-order events never advance past gaps; expired cursor has explicit verified repair. F §10D; R AT22.

Evidence: Not examined in this run; current implementation unknown. Reference: FD112; master line 977.

Master work or verification: Specify repair before enabling feed.

Expected check: Gap holds checkpoint; expired cursor bootstraps public data without touching overlays.

Schema/epoch/access changes are explicit and authoritative; incompatible mandatory schema stops advancement. F §10B-D.

Evidence: Not examined in this run; current implementation unknown. Reference: FD113; master line 978.

Master work or verification: Version/scope protocol and compatibility failure states.

Expected check: Unsupported schema alerts operator, not silently skipped record.

Fixed-cut reconciliation compares IDs/revisions/hashes; index watermark remains separate from sync. F §10D.

Evidence: Not examined in this run; current implementation unknown. Reference: FD114; master line 979.

Master work or verification: Add replay/repair manifest with independently tracked index status.

Expected check: Changing live tables cannot create false consistency; stale index visibly differs.

Independent verification fetches original source, recording deployment/run/cache provenance; cache reread is not independent. F R05/§11; R AT21.

Evidence: Not examined in this run; current implementation unknown. Reference: FD115; master line 980.

Master work or verification: Reuse fetchers with distinct verification provenance; hosting choice only affects deployment mechanics.

Expected check: Deliberately wrong hub deadline is challenged by distinct original-source fetch.

Independent retrieval and extraction agreement are distinct; critical contradictions retain both interpretations. F §11.

Evidence: Not examined in this run; current implementation unknown. Reference: FD116; master line 981.

Master work or verification: Store independent evidence before resolution; label validation method.

Expected check: Same parser on separate fetch is not called extraction-independent.

Separate source research/fetch work from interactive requests; persist accepted work and return truthful progress. JR §4 Keep, §§10.1/13 Phase 1; J pp18-20.

Evidence: Reported whole implementation merged; acceptance remains. Reference: PA05; master line 146.

Master work or verification: Remove page-triggered unauthorized runs; enqueue explicit/approved work through durable owner. Reuse guarded fetcher and current API rather than replacing framework. Keep duplicate operation identity and visible blocked/partial outcomes.

Expected check: Slow host or model does not hold the interactive request/organization lock or block unrelated usable UI. Restart after accepted request preserves job/lead; duplicate request does not duplicate result/spend; no paid work merely from opening page.

Bound aggregate worker/database resource use across API, deploy and job lanes. JR §10.1 corrects J pp19/29-32.

Evidence: Not examined in this run; current implementation unknown. Reference: PA06; master line 147.

Master work or verification: Measure total selected deployment/API/worker connection envelope; configure admission/concurrency to fit it. Keep urgent, maintenance, attachment and long-tail work from starvation. Do not mandate a new broker or arbitrary extra connection pool.

Expected check: Concurrent API traffic, deployment overlap and source workers stay within declared limits; broken host/large PDF cannot starve urgent and long-tail work. Deferred jobs remain visible and recoverable. JR AT17/AT18 plus controlled load evidence.

Source rights, cost and coverage assurance

Traceability group S04; safeguard.

Scope connection: Rights, telemetry, independent evaluation and bounded costs do not become separate product features or approved numeric promises.

Evidence in this group: 12 unexamined in this run.

Coverage benchmark uses exact cycle/track identity, distinct prospect credit and fixed independent denominator. F §15B; R §12/AT28.

Evidence: Not examined in this run; current implementation unknown. Reference: FD121; master line 986.

Master work or verification: Freeze source-stratified cases and joins; no new product scope.

Expected check: EIN/ALN/prior-year hit gets no current-round credit; ambiguous cases stay in denominator; assess expiry and false-open outcomes at both key date and run date.

Stage recall measures inventory→enumeration→capture→representation→identity→sync→browse→notification separately. F §15B; R §12.

Evidence: Not examined in this run; current implementation unknown. Reference: FD122; master line 987.

Master work or verification: Add stage counters and miss diagnosis for frozen pack.

Expected check: Report counts/uncertainty; 100% fixtures not universal real-world coverage.

Every customer miss produces stage diagnosis, owner, remedy and regression fixture. F §15B; R §12.

Evidence: Not examined in this run; current implementation unknown. Reference: FD123; master line 988.

Master work or verification: Link support/coverage record to bounded regression pack.

Expected check: Obscure-source miss becomes preserved test, not popularity suppression.

Value counts unique discoveries, explicit human qualification, handoffs and confirmed external submissions separately. F R17/§15D; R §12.3.

Evidence: Not examined in this run; current implementation unknown. Reference: FD124; master line 989.

Master work or verification: Deduplicate source mentions/history; require status-event evidence for submissions.

Expected check: 1000 imported awards plus two actual submissions remain distinct measures (T16).

Source rights cover storage/processing/redistribution/exit retention before retaining licensed evidence. F §6A/§12B; R §6/AT30.

Evidence: Not examined in this run; current implementation unknown. Reference: FD125; master line 990.

Master work or verification: Verify actual source plan/rights; preserve dependent evidence only under permitted policy.

Expected check: Rights register + actual plan evidence; no unapproved blanket archival promise.

Routine source operations do not silently consume customer drafting allowance. F R14; R §2.

Evidence: Not examined in this run; current implementation unknown. Reference: FD130; master line 1001.

Master work or verification: Trace every discovery/OCR/model route cost owner before billing claim.

Expected check: Usage ledger proves source checks outside drafting allowance; caps still enforced.

Search/source operations remain bounded and preserve work when allowance/provider unavailable. F §7C; R AT16/18.

Evidence: Not examined in this run; current implementation unknown. Reference: FD131; master line 1002.

Master work or verification: Atomic reservation for paid route work plus visible deferred backlog.

Expected check: Concurrent paid source calls respect cap; missing configuration retains candidates/last-good data.

Operational coverage telemetry identifies overdue source jobs, unresolved conflicts, delivery and index lag without raw private content. F §15C.

Evidence: Not examined in this run; current implementation unknown. Reference: FD132; master line 1003.

Master work or verification: Build minimal source outcome dashboard from durable ledgers; no new customer analytics product.

Expected check: Trace source→capture→entity→job IDs; private payload excluded.

Discovery tests use frozen deterministic fixtures plus separately declared live source evaluation. F §17; R §12/§14.

Evidence: Not examined in this run; current implementation unknown. Reference: FD133; master line 1004.

Master work or verification: Map fixture tests to each row and run on pinned candidate.

Expected check: Zero unexplained losses/invented facts; independent live cases and failures reported separately.

Numerical cadences, SLA, load profile, recall thresholds and replay/lease durations are proposals, not approved/achieved promises. F §7C/§10D/§15A; R §7.2/§12.3.

Evidence: Not examined in this run; current implementation unknown. Reference: FD134; master line 1005.

Master work or verification: Preserve proposal status and certify selected profile before promises.

Expected check: Versioned measured benchmark + approved service claims, no invented universal SLA.

Use a frozen exact-cycle benchmark and independent prospective evaluation, explicitly separate from exposed keys/seeds. JR §§12.1-12.3; J pp22-24; F §15B.

Evidence: Not examined in this run; current implementation unknown. Reference: PA08; master line 149.

Master work or verification: Inspect fixture/adapter provenance; treat previously exposed calendars/keys as development data. Freeze independently assembled prospective key, profiles/configs and source strata before scoring. Report date-change adjudication and unresolved mappings without shrinking denominator.

Expected check: Earlier year/ALN/EIN-only cannot earn round hit; duplicates count once. Independent local/private and corporate discoveries are not supplied URLs. Report seeded versus independent routes, counts/uncertainty, false-open cases and stage misses; three reruns of one exposed key are not three independent datasets. JR AT28/AT29.

Measure total source-operation cost and detection/freshness performance, not only marginal model calls. JR §12.3, §13 Phase 3 and §14 final paragraph; F §§15A-D.

Evidence: Not examined in this run; current implementation unknown. Reference: PA09; master line 150.

Master work or verification: Record fetch/search/model/OCR, jobs, database, storage, backup, egress, deployment and human review cost for declared profile; record source-to-detection/field-recheck/queue/query/sync latency and unresolved age.

Expected check: Reproducible cost model includes fixed and marginal components and company payer; route yield/cost uses actual outcomes. Targets stay proposals until selected and measured. No arbitrary customer drafting charge or invented service promise.

Organization onboarding and access

Set up and maintain organization knowledge progressively

Traceability group F23; capability.

Scope connection: Assisted setup/later-document guidance and provisional search are onboarding variants, not completeness gates. One usable sparse profile, including prefill/correction, sponsored organizations, progress, autosave, resume and periodic confirmation. Field variants and setup support are not separate capabilities. Onboarding includes saved progress, teammate continuation and bounded assisted setup. Merge with knowledge/onboarding; setup-call duration is an operating allowance, not a separate capability.

Evidence in this group: 8 unexamined in this run; 10 whole merged; 11 examined baseline partial; 2 residual examined missing or blocked; 2 partial merged; 1 pre-existing locally verified.

First paying customers receive individually scheduled setup from the small team; roughly 30-60 minutes covers access/environment, not document upload or application preparation.

Evidence: Not examined in this run; current implementation unknown. Reference: WA02; master line 232.

Master work or verification: Amend setup operating row; preserve later V9 initial-call/remote-setup refinement.

Expected check: Setup record distinguishes staff environment work from customer uploads/drafting; scheduling is individual, no routine staff-authored rescue.

Provide page explaining additional document types/materials users can add later.

Evidence: Not examined in this run; current implementation unknown. Reference: WA27; master line 257.

Master work or verification: Expose reusable later-materials guidance without mandatory full upload pack.

Expected check: Sparse user reaches explanation of optional next materials and can leave without uploading them.

Verification-pending customer may conduct limited search with clearly provisional results; exact allowance open, drafting during verification undecided.

Evidence: Not examined in this run; current implementation unknown. Reference: WA29; master line 259.

Master work or verification: Separate verification status from permitted provisional search and independently selected drafting gate; no fixed one/two quota.

Expected check: Pending case can perform permitted provisional search; UI shows provisional status, no full verification claim or invented drafting entitlement.

Audited financials, staff profiles, prior grants/proposals and additional program documents are standard later collection, not prerequisites to initial search.

Evidence: Not examined in this run; current implementation unknown. Reference: WA31; master line 261.

Master work or verification: Amend ON02/IN collection with exact later categories and entity-appropriate core-evidence boundary.

Expected check: Search works without these later items; collection UI still offers them, without demanding universal 501(c)(3) or separate sponsored-project EIN.

Start a usable sparse organization without a universal mandatory field pack.

Evidence: Reported whole implementation merged; acceptance remains. Reference: ON01; master line 468.

Master work or verification: P1: relax only nonessential creation gates and persist explicit unknowns.

Expected check: Create sparse profile, search, return and complete it without invented zero values.

Dependency or boundary: Required EIN, geography, annual budget, mission and program currently block creation.

No universal mandatory document pack before exploration.

Evidence: Examined and partial on the baseline; reconcile the gap. Reference: ON02; master line 469.

Examined ledger finding: test-only: create with no documents, discover; clause 2 not traced. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: P1: preserve optional documents while connecting sparse creation.

Expected check: Search with zero uploaded documents; distinguish later funder-specific missing requirements.

Dependency or boundary: Do not turn standard collection categories into required uploads.

Support newly incorporated organizations.

Evidence: Reported whole implementation merged; acceptance remains. Reference: ON03; master line 470.

Master work or verification: P1: manual/tentative path through existing intake.

Expected check: New organization absent from registry reaches useful profile and provisional discovery.

Dependency or boundary: Existing registry-only path conflicts; readiness help is not automatic rejection.

Support volunteer-led organizations.

Evidence: Examined and partial on the baseline; reconcile the gap. Reference: ON04; master line 471.

Examined ledger finding: test-only: volunteer-led fixture through create/profile/discover. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: P1: verify no paid-staff or tenure assumption; fix only demonstrated gate.

Expected check: Volunteer-led fixture completes initial intake and ongoing use.

Dependency or boundary: No report establishes this organization type end to end.

Distinguish fiscal sponsor from sponsored project.

Evidence: Reported whole implementation merged; acceptance remains. Reference: ON05; master line 472.

Master work or verification: P1: separate project and sponsor legal identity in existing profile.

Expected check: Sponsored project and sponsor display as distinct linked records.

Dependency or boundary: Schema currently expects organization own EIN.

Associate EIN with the proper legal entity, not automatically the project.

Evidence: Reported whole implementation merged; acceptance remains. Reference: ON06; master line 473.

Master work or verification: P1: optional project EIN plus sponsor legal identity; eligibility consumes applicant of record.

Expected check: Grant asking for sponsor uses sponsor EIN; project cannot overwrite it.

Dependency or boundary: Exact sponsor field set/general no-EIN verification remain open.

Sponsored project need not have its own EIN.

Evidence: Reported whole implementation merged; acceptance remains. Reference: ON07; master line 474.

Master work or verification: P1: remove unconditional project-EIN validation without relaxing tenant identity.

Expected check: Create sponsored project with no project EIN and valid sponsor association.

Dependency or boundary: Required EIN regex is a concrete conflict.

Registry miss offers explained manual/tentative entry and initial help.

Evidence: Reported whole implementation merged; acceptance remains. Reference: ON08; master line 475.

Master work or verification: P1: add not-listed path with tentative provenance and explanation.

Expected check: No IRS hit produces editable entry, not dead end or invented registry result.

Dependency or boundary: Manual entry is approved; exact verification workflow not fully specified.

Prefill organization information from registry and 990 records.

Evidence: Examined and partial on the baseline; reconcile the gap. Reference: ON09; master line 476.

Examined ledger finding: no source per field after create (ON11 change); live check OUT. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: P1: reuse registry/filing lookups and preserve source attribution.

Expected check: Demonstrate returned filing facts, source and inline corrections on pinned build.

Dependency or boundary: Connected-main report is not production or accuracy proof.

Enrich from organization website/name matching and MCP/web sources.

Evidence: Examined gap or blocker remains in the supplied evidence. Reference: ON10; master line 477.

Examined ledger finding: row: MCP servers absent from images; provider not settled. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: P1: connect approved enrichment routes, matching and review; route/privacy evidence first.

Expected check: Website and registry disagree; review identifies sources and no cross-organization match.

Dependency or boundary: MCP servers reportedly absent from deployed images; provider not settled.

Prefill and let users correct the profile mission.

Evidence: Only part merged; finish the residual and accept. Reference: ON11; master line 478.

Master work or verification: P1: trace mission through compiled profile and inline confirmation; add only absent mapping.

Expected check: Change mission, reload and inspect source plus confirmed value.

Dependency or boundary: Whole-profile enrichment does not establish every field path.

Prefill and let users correct the profile programs.

Evidence: Examined and partial on the baseline; reconcile the gap. Reference: ON12; master line 479.

Examined ledger finding: as ON11, a source per program. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: P1: trace programs through compiled profile and inline confirmation; add only absent mapping.

Expected check: Change programs, reload and inspect source plus confirmed value.

Dependency or boundary: Whole-profile enrichment does not establish every field path.

Prefill and let users correct the profile people.

Evidence: Examined and partial on the baseline; reconcile the gap. Reference: ON13; master line 480.

Examined ledger finding: test-only: a 990 person corrected keeps source + new value. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: P1: trace people through compiled profile and inline confirmation; add only absent mapping.

Expected check: Change people, reload and inspect source plus confirmed value.

Dependency or boundary: Whole-profile enrichment does not establish every field path.

Prefill and let users correct the profile location.

Evidence: Examined and partial on the baseline; reconcile the gap. Reference: ON14; master line 481.

Examined ledger finding: as ON11. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: P1: trace location through compiled profile and inline confirmation; add only absent mapping.

Expected check: Change location, reload and inspect source plus confirmed value.

Dependency or boundary: Whole-profile enrichment does not establish every field path.

Prefill and let users correct the profile budget.

Evidence: Examined and partial on the baseline; reconcile the gap. Reference: ON15; master line 482.

Examined ledger finding: ON11 + a budget field at onboarding. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: P1: trace budget through compiled profile and inline confirmation; add only absent mapping.

Expected check: Change budget, reload and inspect source plus confirmed value.

Dependency or boundary: Whole-profile enrichment does not establish every field path.

Reconcile apparent freshness without silently overriding confirmed profile facts.

Evidence: Examined and partial on the baseline; reconcile the gap. Reference: ON16; master line 483.

Examined ledger finding: no website read (ON10); choose-the-change only for readiness facts. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: P1/P3: preserve accepted value; present later external differences for review.

Expected check: Newer website conflicts with confirmed figure; confirmed figure stays until chosen change.

Dependency or boundary: Earlier newest-upload wording is not blanket authority; D440-442 also prohibits that.

Autosave all onboarding fields.

Evidence: Only part merged; finish the residual and accept. Reference: ON17; master line 484.

Master work or verification: P1: persist partial intake server-side independently of model calls.

Expected check: Edit each field, close/reopen browser and recover accepted server state.

Dependency or boundary: Current draft is browser-only; no mandatory Save button is approved.

Show progress and remaining onboarding steps.

Evidence: Examined and partial on the baseline; reconcile the gap. Reference: ON18; master line 485.

Examined ledger finding: progress not from saved answers; rides ON17. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: P1: verify existing indicators against persisted state, then fill gap.

Expected check: Progress reflects saved answers and remaining steps, including partial failures.

Dependency or boundary: No fixed completion percentage algorithm is approved.

Back-navigation permits correction of earlier intake.

Evidence: Examined and partial on the baseline; reconcile the gap. Reference: ON19; master line 486.

Examined ledger finding: re-picking the same EIN blanks typed answers (choose(), onboard.tsx:95): keep them; web only. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: P1: retain Back while server persistence is connected.

Expected check: Back, correct earlier answer, continue without losing later saved answers.

Dependency or boundary: Existing Back alone does not prove persistence.

Resume onboarding at saved point after leaving or sign-out.

Evidence: Reported whole implementation merged; acceptance remains. Reference: ON20; master line 487.

Master work or verification: P1: durable draft and saved-point retrieval.

Expected check: Sign out and return after session expiry; same profile and step recover.

Dependency or boundary: Browser-only draft loses progress on sign-out.

An authorized teammate can continue saved onboarding.

Evidence: Reported whole implementation merged; acceptance remains. Reference: ON21; master line 488.

Master work or verification: P1 plus current authorization: shared server draft, revision guard.

Expected check: Teammate with permission resumes; unauthorized teammate cannot read/edit.

Dependency or boundary: No teammate continuation reported.

End onboarding with a single editable all-profile readout.

Evidence: Examined and partial on the baseline; reconcile the gap. Reference: ON22; master line 489.

Examined ledger finding: one final review page over the saved profile; rides ON17. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: P1: final review over compiled profile, not replacement forms.

Expected check: Review all saved profile sections and correct before finishing.

Dependency or boundary: Existing review is pre-creation filing review, not final all-profile review.

Track last overview confirmation and prompt at six months.

Evidence: Reported whole implementation merged; acceptance remains. Reference: ON23; master line 490.

Master work or verification: P1: confirmed-on field and bounded overview confirmation.

Expected check: Older overview prompts confirmation without declaring every fact invalid.

Dependency or boundary: Six-month overview differs from user-chosen document reminders.

Saved partial intake is independent of a model run.

Evidence: Reported whole implementation merged; acceptance remains. Reference: ON30; master line 497.

Master work or verification: P1: deterministic persistence; do not charge or require inference for saving.

Expected check: Disable model route; manual intake saves, resumes and remains editable.

Dependency or boundary: Browser-only persistence does not satisfy durable save.

Initial assisted setup then independent ongoing use.

Evidence: Examined gap or blocker remains in the supplied evidence. Reference: ON32; master line 499.

Examined ledger finding: hosted setup + paid drafting. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: P1 plus full journey: demonstrate setup with in-product ongoing guidance.

Expected check: After one initial setup, customer finishes normal ongoing work without staff authoring/rescue.

Dependency or boundary: 30-60-minute call/approximately 30 clients are operating assumptions, not capacity guarantee.

Initial purchaser verification and primary-user/roster/access collection are assisted setup, not ongoing staff gate.

Evidence: Pre-existing behavior verified locally; acceptance remains. Reference: ON46; master line 513.

Master work or verification: P1/operations: verify bounded setup verification/reference and ordinary self-service transition.

Expected check: Initial authorized setup records roster/rights; later membership tasks do not require staff intervention.

Dependency or boundary: Claim approval/provisioning exists; exact purchaser verification and turnaround not evidenced.

Initial organization setup offers progress/remaining steps and back-editing.

Evidence: Not examined in this run; current implementation unknown. Reference: UX038; master line 2295.

Master work or verification: Server-backed saved progress and back-edit verified; detailed intake rows owned separately.

Return to intake at saved point, including after a week or by authorized teammate.

Evidence: Not examined in this run; current implementation unknown. Reference: UX039; master line 2296.

Master work or verification: Different session/user authorized continuation with expiry/access cases; browser-only state insufficient.

First-session direction: setup and sufficient documents yield credible manageable opportunities; not mandatory full application.

Evidence: Not examined in this run; current implementation unknown. Reference: UX040; master line 2297.

Master work or verification: Observe representative session; keep time aspirational until chosen threshold, no forced upload pack.

Initial approximately 30 clients may receive one 30-60 minute setup call then remote setup/deployment.

Evidence: Not examined in this run; current implementation unknown. Reference: UXO010; master line 2407.

Master work or verification: Representative setup and staffing plan; remote setup does not itself require customer cloud subscription or automated provisioning.

Choose guidance and practice the workflow

Traceability group F25; capability.

Scope connection: User-selectable orientation, walkthrough or novice practice are one guidance capability. Guidance levels, switching help off/on and safe practice are one guided-learning experience.

Evidence in this group: 4 residual examined missing or blocked; 1 examined baseline partial; 5 unexamined in this run.

User chooses expert short feature orientation.

Evidence: Examined gap or blocker remains in the supplied evidence. Reference: ON24; master line 491.

Examined ledger finding: per-person setting (JSON keyed by member, or a members column = migration) + content. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: P1: person-level guidance choice using existing explanatory surfaces.

Expected check: Expert selects short orientation and can proceed directly.

Dependency or boundary: No guidance setting found in settings/store/shell.

User chooses intermediate detailed product/page walkthrough.

Evidence: Examined gap or blocker remains in the supplied evidence. Reference: ON25; master line 492.

Examined ledger finding: per-person setting (JSON keyed by member, or a members column = migration) + content. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: P1: intermediate guidance variant.

Expected check: Intermediate mode gives product/page help without forced novice practice.

Dependency or boundary: No report demonstrates mode-specific behavior.

User chooses novice full guidance.

Evidence: Examined gap or blocker remains in the supplied evidence. Reference: ON26; master line 493.

Examined ledger finding: per-person setting (JSON keyed by member, or a members column = migration) + content. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: P1: novice path with in-product help and recovery.

Expected check: Novice reaches next steps without staff writing or hidden knowledge.

Dependency or boundary: Dev sample fixture is not hosted onboarding.

Guidance can be changed or switched off/on.

Evidence: Examined gap or blocker remains in the supplied evidence. Reference: ON27; master line 494.

Examined ledger finding: per-person setting (JSON keyed by member, or a members column = migration) + content. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: P1: persist choice per person; expose Settings control.

Expected check: Toggle off, later restore/change mode without losing work.

Dependency or boundary: No fixed expertise assumption or collaborator default.

Beginner practice is clearly labeled before real work and cannot imply real submission.

Evidence: Examined and partial on the baseline; reconcile the gap. Reference: ON28; master line 495.

Examined ledger finding: no labelled customer practice path; no guard against a real submission from practice. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: P1: adapt existing synthetic fixture into clearly labeled practice path.

Expected check: Practice teaches selection/reversal/question upload/drafting; cannot mark a real funder submission.

Dependency or boundary: Fixture exists only in development; hosted practice missing.

Three user-selected guidance levels: expert orientation, intermediate walkthrough, fully guided novice.

Evidence: Not examined in this run; current implementation unknown. Reference: UX033; master line 2290.

Master work or verification: Persist per-person mode and demonstrate each guided route with common quality safeguards. Identical quality across modes was not independently confirmed as a Q10 decision.

Experienced users can turn extra guidance off and reenable it in Settings.

Evidence: Not examined in this run; current implementation unknown. Reference: UX034; master line 2291.

Master work or verification: Persist off/changed level across sessions and navigation.

Novice example is clearly labeled practice before real grant work.

Evidence: Not examined in this run; current implementation unknown. Reference: UX035; master line 2292.

Master work or verification: Customer-reachable synthetic practice with explicit labels, never mistaken for real submitted work.

Practice teaches selections, changing prior choices, question upload and draft workflow.

Evidence: Not examined in this run; current implementation unknown. Reference: UX036; master line 2293.

Master work or verification: Guided exercise coverage and user walkthrough; dev fixture alone insufficient.

Practice cannot create a fictitious submission to a real funder.

Evidence: Not examined in this run; current implementation unknown. Reference: UX037; master line 2294.

Master work or verification: Negative submit test on practice and clear exit to real application.

Manage collaborators, scoped roles and organization ownership

Traceability group F26; capability.

Scope connection: Self-service member administration, sole-admin recovery, ownership boundaries and last-admin transfer form organization access administration. One access-management capability includes independent rights, scoped/expiring contractors, membership checks and revocation. Role variants are not separate features. Organization ownership continuity, last-admin protection and verified operator recovery form one account-administration outcome.

Evidence in this group: 2 pre-existing locally verified; 2 examined baseline partial; 16 unexamined in this run.

Ordinary authorized user administration stays self-service after setup.

Evidence: Pre-existing behavior verified locally; acceptance remains. Reference: ON33; master line 500.

Master work or verification: P1/identity: retain add/re-role/remove mechanics; validate capability mapping.

Expected check: Authorized admin manages ordinary members; unauthorized user cannot.

Dependency or boundary: Existing directors not necessarily final target permission labels.

Primary organization ownership is distinct and changeable only by Centring.

Evidence: Examined and partial on the baseline; reconcile the gap. Reference: ON34; master line 501.

Examined ledger finding: primary_owner in claim.json via admin route; no migration. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: P1/identity: primary-owner field with Centring-controlled transition.

Expected check: Ordinary admin cannot transfer primary owner; attributed Centring transition can.

Dependency or boundary: Existing admin claim transfer is not primary-owner model.

Unavailable sole-admin recovery records verified organizational authority and operator history.

Evidence: Examined and partial on the baseline; reconcile the gap. Reference: ON35; master line 502.

Examined ledger finding: require a verification reference + reason. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: Identity dependency: separate recovery operation requiring verification reference.

Expected check: Unverified requester rejected; verified role repair has actor/reason/reference.

Dependency or boundary: Free-text admin transfer note is not verified authority evidence.

Last admin must transfer administrator role before leaving.

Evidence: Pre-existing behavior verified locally; acceptance remains. Reference: ON45; master line 512.

Master work or verification: Identity owner: retain last-director leave/remove guard and clarify role versus primary owner.

Expected check: Sole admin cannot leave until another authorized admin accepts appropriate role.

Dependency or boundary: Guard does not authorize ordinary primary-owner transfer or recovery for unverified requester.

Recheck current membership on every protected request, including an already-open session.

Evidence: Not examined in this run; current implementation unknown. Reference: IAM-001; master line 1902.

Master work or verification: Host adapters are not built; token life cannot substitute for permission revocation.

Expected check: Removal during open native/Docs/Word sessions blocks next protected read/write/proposal.

Revocation must fence queued and running effects, not merely the next user HTTP call.

Evidence: Not examined in this run; current implementation unknown. Reference: IAM-002; master line 1903.

Master work or verification: Tie current access to dispatch and commit/adoption fences.

Expected check: Revoke after admission and during provider call; no later protected effect/result adoption.

Contractor access can be organization-wide or limited to programs/applications.

Evidence: Not examined in this run; current implementation unknown. Reference: IAM-003; master line 1904.

Master work or verification: Add scoped grants to existing membership system.

Expected check: Positive/negative matrix across allowed and foreign programs/apps.

Contractor grants can expire and expiration is enforced at effect time.

Evidence: Not examined in this run; current implementation unknown. Reference: IAM-004; master line 1905.

Master work or verification: Same grant/worker/host checks as revocation.

Expected check: Expiry during active sessions/queued jobs denies subsequent effects.

Admin independently chooses collaborator search, draft and edit rights without a fixed bundled default.

Evidence: Not examined in this run; current implementation unknown. Reference: IAM-005; master line 1906.

Master work or verification: Map current role checks, add capability-specific grants only where needed.

Expected check: All relevant combinations work without granting unrelated capabilities.

External collaborators never receive organization ownership or billing authority.

Evidence: Not examined in this run; current implementation unknown. Reference: IAM-006; master line 1907.

Master work or verification: Encode explicit exclusion in grant validation and server checks.

Expected check: Admin cannot grant prohibited collaborator powers through UI or API.

Multiple roles/co-executives are supported; display title itself is not authority.

Evidence: Not examined in this run; current implementation unknown. Reference: IAM-007; master line 1908.

Master work or verification: V13/named delegated approval controls; do not reopen title-as-power decision.

Expected check: Titles alone fail approval, actual grants work; multi-role/effective-tenure cases.

Support assignment itself grants no customer-content access.

Evidence: Not examined in this run; current implementation unknown. Reference: IAM-021; master line 1922.

Master work or verification: Repair board role without widening tenant document rights.

Expected check: Support-only ticket access works; private content unavailable absent specific grant.

Permission history/tenure remains attributable after departure, with pending assignments handled deliberately.

Evidence: Not examined in this run; current implementation unknown. Reference: IAM-022; master line 1923.

Master work or verification: Reuse audit and owner data, avoid rewriting historical decisions.

Expected check: Departed actor history retained; current pending owners/recipients valid.

Hide inaccessible records/counts; explain visible unavailable actions.

Evidence: Not examined in this run; current implementation unknown. Reference: UX020; master line 2277.

Master work or verification: UI/API negative role matrix and count tests; underlying RLS is not all-screen proof.

Open-page access loss disables next protected action and functioning write affordance.

Evidence: Not examined in this run; current implementation unknown. Reference: UX021; master line 2278.

Master work or verification: Revoke during every relevant screen; next action denied and UI refreshes without leakage.

Organization primary owner differs from app owner and administrator role.

Evidence: Not examined in this run; current implementation unknown. Reference: IAM-014; master line 1915.

Master work or verification: Model distinct concepts; no schema-key choice needed from user.

Expected check: Role changes cannot silently transfer primary ownership.

Only Centring may change/remove/transfer primary organization owner.

Evidence: Not examined in this run; current implementation unknown. Reference: IAM-015; master line 1916.

Master work or verification: Distinguish owner transfer from admin-role repair.

Expected check: Ordinary admin transfer denied; bounded Centring act audited against intended owner.

Last-admin departure protection preserves continuity without granting ordinary users primary-owner transfer.

Evidence: Not examined in this run; current implementation unknown. Reference: IAM-016; master line 1917.

Master work or verification: Reconcile with new owner terminology and recovery path.

Expected check: Last-admin leave/remove cases, authorized successor and unavailable-admin recovery.

Sole-admin access repair requires verification of requester's organizational authority.

Evidence: Not examined in this run; current implementation unknown. Reference: IAM-017; master line 1918.

Master work or verification: Add required verification reference and bounded operator process.

Expected check: Unverified claimant cannot trigger repair; verified request linked to attributable evidence.

Operator recovery/role repair must retain operator, subject, action, time and reason without granting unrestricted content access.

Evidence: Not examined in this run; current implementation unknown. Reference: IAM-018; master line 1919.

Master work or verification: Separate maintenance/recovery privilege from routine all-tenant content power.

Expected check: Audit lineage and negative content-access tests for recovery-only operator.

Protect sign-in and authorized context

Traceability group S05; safeguard.

Scope connection: Identity, safe loading, access-state distinctions, recovery and current mobile permissions are crosscutting access/UX contracts, not separate customer goals.

Evidence in this group: 2 pre-existing locally verified; 3 examined baseline partial; 1 whole merged; 1 residual examined missing or blocked.

Sign in through existing identity mechanism and show only authorized customer context.

Evidence: Pre-existing behavior verified locally; acceptance remains. Reference: ON36; master line 503.

Master work or verification: P1/identity: retain proxy/session/membership path and verify context switching only if supported.

Expected check: Two-organization fixture exposes only permitted context and correct tenant data after login.

Dependency or boundary: Membership/RLS reported; Microsoft/Google sign-in identity is not tenant integration.

Loading authentication never exposes cached private details before authorization.

Evidence: Examined and partial on the baseline; reconcile the gap. Reference: ON37; master line 504.

Examined ledger finding: test-only: /me held then 401, nothing of the org drawn. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: P1/frontend/identity: inspect loading/cache transition and current membership check.

Expected check: Revoked or signed-out session loads no protected cached profile before access decision.

Dependency or boundary: Backend RLS tests do not prove client-side cached-content behavior.

No membership is an access state distinct from empty Home.

Evidence: Reported whole implementation merged; acceptance remains. Reference: ON38; master line 505.

Master work or verification: P1: map unknown-client 404 into accurate access-state UI.

Expected check: Valid signed-in nonmember sees access explanation, not empty successful organization.

Dependency or boundary: Backend 404 reported; final UI meaning not verified.

Expired/failed sign-in has existing recovery without losing safe intended context.

Evidence: Pre-existing behavior verified locally; acceptance remains. Reference: ON39; master line 506.

Master work or verification: P1/identity: trace sign-out/recovery and safe destination retention.

Expected check: Expired session recovers to authorized destination; failed email delivery does not claim successful sign-in.

Dependency or boundary: Email-link sender historically unconfigured; deep-link retention is recommended, not new required auth design.

Revocation denies access rather than repeated bad-password prompts.

Evidence: Examined and partial on the baseline; reconcile the gap. Reference: ON40; master line 507.

Examined ledger finding: no next-read assertion after removal by a director; no web "access changed" state. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: P1/identity: retain next-request refusal and correctly classify revoked scope.

Expected check: Remove member; next protected read denied and UI explains access change.

Dependency or boundary: Queued/running revocation belongs RUN/identity owner; refusal alone not full shutdown proof.

Loading, empty, read-only, quarantine and failed-field states remain distinct.

Evidence: Examined and partial on the baseline; reconcile the gap. Reference: ON31; master line 498.

Examined ledger finding: no per-field failure state in intake; no read-only intake state. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: P1/P2: preserve successful fields and expose precise error states.

Expected check: Failed field/extraction retains other answers; read-only user sees no false completed check.

Dependency or boundary: Quarantine support does not establish every intake state.

Mobile companion organization lookup uses same current permitted records as desktop.

Evidence: Examined gap or blocker remains in the supplied evidence. Reference: ON41; master line 508.

Examined ledger finding: declared mobile browsers on the hosted build. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: P1/frontend: demonstrate scoped organization lookup on declared mobile browsers.

Expected check: Update desktop profile then authorized mobile lookup reflects it; revoked user denied.

Dependency or boundary: Mobile scope decided; support/conformance remains unverified.

Close a personal or organization account

Traceability group F27; capability.

Scope connection: Scoped account/organization deletion with confirmations and truthful retention behavior; entity variants are not separate features. Organization closure/offboarding includes truthful held-copy disclosures and revocation, while export is separately reusable. Exact retention choices remain open. Personal account deletion is explicitly distinct from leaving an organization or deleting the organization.

Evidence in this group: 1 examined baseline partial; 2 residual examined missing or blocked; 6 unexamined in this run.

Organization deletion available only to admin/owner with typed confirmation.

Evidence: Examined and partial on the baseline; reconcile the gap. Reference: ON42; master line 509.

Examined ledger finding: director confirms by typing the org name; staff 403; code calls admin-only a deliberate human gate v. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: Identity/retention owner: adapt existing deletion receipt/typed-confirmation route to approved authority.

Expected check: Authorized organization admin/owner can confirm correct organization; ordinary member denied.

Dependency or boundary: Current route only Centring deployment admin, conflicting with V7; not actual deletion authority here.

Organization deletion sends accurate confirmation reflecting verified retention behavior.

Evidence: Examined gap or blocker remains in the supplied evidence. Reference: ON43; master line 510.

Examined ledger finding: row: 90-day proposal not approved. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: Notification/retention owner: sender plus factual deletion receipt template after policy selection.

Expected check: Confirmed delete sends exact scope/state without unapproved purge/backup promise.

Dependency or boundary: No confirmation email found; 90-day proposal not approved law or duration.

Personal-account deletion never implicitly deletes organization.

Evidence: Examined gap or blocker remains in the supplied evidence. Reference: ON44; master line 511.

Examined ledger finding: account delete through the last-director guard; retention question for audit rows. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: Identity owner: separate personal deletion from leave and organization deletion.

Expected check: Delete one user account; organization/shared records remain under valid members.

Dependency or boundary: Personal deletion not found, only leave exists.

Organization deletion can be initiated by its authorized admin/owner, not only Centring deployment admin.

Evidence: Not examined in this run; current implementation unknown. Reference: IAM-020; master line 1921.

Master work or verification: Correct authorization while preserving final confirmation/hold policy.

Expected check: Owner/admin happy path and outsider denial with receipt and actual authorized scope.

Organization deletion requires accurate confirmation/email/history, consistent with actual held-copy/purge policy.

Evidence: Not examined in this run; current implementation unknown. Reference: RET-015; master line 2012.

Master work or verification: Email mechanism and selected retention; old 30-day value not approved new policy.

Expected check: Confirmed actor/scope, nonoptional security notification and honest deletion state.

Offboarding revokes sessions, entitlements, integrations, hub/support access and recurring jobs only after preservation; failed external revocations remain retryable.

Evidence: Not examined in this run; current implementation unknown. Reference: RET-022; master line 2019.

Master work or verification: Keep receipts/current protection journal; separate runtime deletion from access termination.

Expected check: Partial revocation retry without duplicate export/destructive loss or false complete.

Provider-held copies and accepted API/retention terms are explicitly accounted for in deletion/offboarding.

Evidence: Not examined in this run; current implementation unknown. Reference: RET-023; master line 2020.

Master work or verification: Request route-specific accepted terms/settings; don't claim that Centring can erase all vendor copies.

Expected check: Approved contractual/configuration map and accurate residual-copy/deletion obligations.

Private data is not retained or reused by Centring merely because customer departs.

Evidence: Not examined in this run; current implementation unknown. Reference: RET-024; master line 2021.

Master work or verification: Separate lawful audit/hold/processor obligations from optional business reuse.

Expected check: Termination invalidates purposes; retained exceptions scoped and nonserving.

Personal account deletion is distinct from merely leaving an organization.

Evidence: Not examined in this run; current implementation unknown. Reference: RET-014; master line 2011.

Master work or verification: Define identity versus attributable organization history and current admin continuity.

Expected check: Account erasure/retained-history receipts, no orphaned sole-admin path.

Export complete customer records for exit

Traceability group F54; capability.

Scope connection: Usable original files/history/relationships plus verified IDs and consistent export form one portability outcome; checks are not extra capabilities.

Evidence in this group: 7 unexamined in this run.

Customer exit provides usable original uploads, private records/history, relationships, handoffs and retained public provenance.

Evidence: Not examined in this run; current implementation unknown. Reference: RET-016; master line 2013.

Master work or verification: Complete bounded customer export, attempt permitted hydration of entitled remote-only artifacts, and visibly record unavailable-original or rights exceptions.

Expected check: Export manifest maps every retained object and reconstructs usable records; unavailable remote originals are reported and cannot be falsely marked preserved.

Exit files preserve IDs, revisions, links, timestamps and schema dictionary in usable machine/readable formats.

Evidence: Not examined in this run; current implementation unknown. Reference: RET-017; master line 2014.

Master work or verification: Full fidelity plus readable document index; exact formats are source design unless selected.

Expected check: Offline importer/readable index and referential checks against source cut.

Customer export remains usable without active login or expiring platform-only URLs.

Evidence: Not examined in this run; current implementation unknown. Reference: RET-018; master line 2015.

Master work or verification: Deliver entitled bytes to durable client-controlled destination, attempting permitted hydration of remote-only originals.

Expected check: Revoke application access then open retained export; unavailable originals remain explicit exceptions.

Exit quiesces/fences writes and exports a consistent cut before revoking access.

Evidence: Not examined in this run; current implementation unknown. Reference: RET-019; master line 2016.

Master work or verification: One idempotent job/checkpoint/manifest; do not require a prohibited company snapshot.

Expected check: Concurrent-write/corrupt-transfer/retry tests preserve consistent customer cut.

Verify hashes/counts/relations and durable receipt before declaring customer preservation complete.

Evidence: Not examined in this run; current implementation unknown. Reference: RET-020; master line 2017.

Master work or verification: Reuse immutable storage/export machinery.

Expected check: Deliberately corrupt/missing files or unhydrated entitled originals prevent a false complete state and keep permitted retry possible.

Do not require a company sensitive-document exit snapshot as a prerequisite to customer export.

Evidence: Not examined in this run; current implementation unknown. Reference: RET-021; master line 2018.

Master work or verification: F's mandatory dual export is not silently carried forward; narrower reuse separately approved.

Expected check: Customer export succeeds with company archive prohibited; no shadow snapshot created.

Customer exit leaves usable verified records and does not create prohibited sensitive Centring archive.

Evidence: Not examined in this run; current implementation unknown. Reference: UXO052; master line 2449.

Master work or verification: Export/exit workstream evidence plus operator rehearsal; no legacy dual-archive requirement retained.

Request support or submit feedback with approved diagnostics

Traceability group F55; capability.

Scope connection: One support/feedback workflow includes distinct request types, ticket state and reviewed diagnostic attachment. Privacy conditions and service targets do not add features.

Evidence in this group: 18 unexamined in this run.

Provide basic support-ticket submission.

Evidence: Not examined in this run; current implementation unknown. Reference: UXS001; master line 2376.

Master work or verification: Candidate end-to-end create/status test; local ticket rules reported, production mail not demonstrated.

Suggestions are a distinct channel/type from incidents/help.

Evidence: Not examined in this run; current implementation unknown. Reference: UXS002; master line 2377.

Master work or verification: Show separate problem/help/idea classification and routing without inventing a new service desk.

Support entry has category, description and safe contextual reference.

Evidence: Not examined in this run; current implementation unknown. Reference: UXS003; master line 2378.

Master work or verification: Inspect actual form/reference and permitted payload; exact shell placement remains proposed.

Ticket state/replies are visible where existing mechanism supports them.

Evidence: Not examined in this run; current implementation unknown. Reference: UXS004; master line 2379.

Master work or verification: Customer status/reply journey; support-only board permission defect resolved.

Show actual proposed diagnostic contents before transmission.

Evidence: Not examined in this run; current implementation unknown. Reference: UXS005; master line 2380.

Master work or verification: Exact-payload preview includes all automatically collected rows, paths, notes and identifiers.

User must approve diagnostic sharing before send.

Evidence: Not examined in this run; current implementation unknown. Reference: UXS006; master line 2381.

Master work or verification: Consent tied to previewed scope; declining/canceling transmits zero diagnostics.

Descriptions/checkmarks do not substitute for preview of selected screenshot/action-tail contents.

Evidence: Not examined in this run; current implementation unknown. Reference: UXS007; master line 2382.

Master work or verification: Preview real selected data, not label-only attachment consent.

No always-attached hidden diagnostics.

Evidence: Not examined in this run; current implementation unknown. Reference: UXS008; master line 2383.

Master work or verification: Remove silent openTicket attachments or include in explicit approved payload; test packet.

Private documents/application text are excluded by default.

Evidence: Not examined in this run; current implementation unknown. Reference: UXS009; master line 2384.

Master work or verification: Redaction tests inspect notes, screenshots, tails and request metadata for private content.

Private relationships, prompts and output bodies excluded by default.

Evidence: Not examined in this run; current implementation unknown. Reference: UXS010; master line 2385.

Master work or verification: Dedicated seeded sensitive payloads absent unless separate authorized sharing.

Diagnostic retention and operator access are explicitly controlled.

Evidence: Not examined in this run; current implementation unknown. Reference: UXS011; master line 2386.

Master work or verification: Route manifest and retention/access tests; privacy section owns exact policy.

Failed support submission preserves draft and reconciles uncertain delivery before retry.

Evidence: Not examined in this run; current implementation unknown. Reference: UXS012; master line 2387.

Master work or verification: Timeout after acceptance, retry and offline fixture prevent duplicate ticket/lost text.

Support assignment does not grant private client-content access.

Evidence: Not examined in this run; current implementation unknown. Reference: UXS013; master line 2388.

Master work or verification: Support-only role reaches permitted board without content grants; tenant/content permission matrix.

Support-only personnel can access the authorized support board.

Evidence: Not examined in this run; current implementation unknown. Reference: UXS014; master line 2389.

Master work or verification: Fix S17 denial only within support scope; role test positive and forbidden client data negative.

Do not promise response time before operational coverage agreed.

Evidence: Not examined in this run; current implementation unknown. Reference: UXS015; master line 2390.

Master work or verification: Support copy and schedule/owner review; W two-business-day wording not a completion SLA.

Preserve two-business-day verification/owner-request target ambiguity and no urgent guarantee.

Evidence: Not examined in this run; current implementation unknown. Reference: UXS016; master line 2391.

Master work or verification: Clarify response vs completion before an SLA; urgent-contact route makes no guarantee.

Empty ticket history invites new request, never implies no earlier failures.

Evidence: Not examined in this run; current implementation unknown. Reference: UXS017; master line 2392.

Master work or verification: History empty/fetch-failed states clearly distinct.

Support users see and approve the actual proposed diagnostic payload before sending.

Evidence: Not examined in this run; current implementation unknown. Reference: SEC-021; master line 1949.

Master work or verification: Show the actual proposed payload and obtain approval; per-item selection is optional, not a required product decision. Preserve request on failure.

Expected check: Cancel sends none; the approved actual payload matches transmitted diagnostics exactly.

Knowledge Library programs and relationships

Maintain private funder contacts and interaction history

Traceability group F19; capability.

Scope connection: Funder profiles and contact/exchange history before and after Pursue. Private funder/contact directory with sourced public facts, dated roles and relationship observations, correction, search and merge/split. Privacy/access/failure variants remain acceptance contracts. Dated interactions and linked application/cycle history can be reviewed by person, date and funder without an active application. Filters are not separate capabilities.

Evidence in this group: 2 other unmerged build; 3 pre-existing locally verified; 8 unexamined in this run; 3 examined baseline partial; 2 residual examined missing or blocked; 4 whole merged.

Private funder profile can be created before Pursue. G V23/S18.

Evidence: Built and reviewed for int-b7; not yet merged. Reference: LC032; master line 1161.

Master work or verification: Add linked tenant-private funder identity without forcing application creation.

Expected check: Create/read profile with no application or public promotion.

Private funder contacts/exchanges can be recorded before Pursue. G V23/S18.

Evidence: Pre-existing behavior verified locally; acceptance remains. Reference: LC033; master line 1162.

Master work or verification: Retain; extend links/search rather than replace people/exchange store.

Expected check: New contact/exchange does not create application or send outreach.

History can be found by funder and useful person/date context without confusing public staff facts with private relationships. G S18; W Q25 funder-grouped history.

Evidence: Not examined in this run; current implementation unknown. Reference: LC034; master line 1163.

Master work or verification: Add funder/profile linkage and person/date search/tenure as required.

Expected check: Multiple applications/exchanges grouped under correct funder; dated roles remain historical.

Create tenant-private contact before Pursue/application.

Evidence: Pre-existing behavior verified locally; acceptance remains. Reference: PE01; master line 632.

Master work or verification: P4: retain existing people creation; test current scope.

Expected check: Create At a funder contact with no application; unauthorized tenant cannot read it.

Dependency or boundary: Any-member API is reported, not proof target collaborator scope is correct.

Create tenant-private funder profile before Pursue/application.

Evidence: Built and reviewed for int-b7; not yet merged. Reference: PE02; master line 633.

Master work or verification: P4: private funder profile linked to public identity, reusing current names/EINs.

Expected check: Create profile before application and later pursue without duplicating private notes.

Dependency or boundary: Free-text funder name/EIN is not profile record.

Reuse/link private profile and contacts when later application starts.

Evidence: Examined and partial on the baseline; reconcile the gap. Reference: PE03; master line 634.

Examined ledger finding: profile link. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: P4/handoff: lookup by private/public identity and preserve links.

Expected check: Preexisting funder/contact reappears on Pursue with same ID/history.

Dependency or boundary: Profile missing; full reuse linkage not evaluated.

Searchable list/detail combines public facts and clearly private history.

Evidence: Examined and partial on the baseline; reconcile the gap. Reference: PE04; master line 635.

Examined ledger finding: funder list. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: P4: extend current people/exchange views and source-backed public identity.

Expected check: List and detail label public versus tenant-private content without cross-tenant search leaks.

Dependency or boundary: Separate Funders/People navigation remains audit-dependent, not a 23-screen build mandate.

Private contacts support correction under current permission.

Evidence: Pre-existing behavior verified locally; acceptance remains. Reference: PE05; master line 636.

Master work or verification: P4: verify edit/correction path and scoped permission.

Expected check: Correct same-name contact and retain attribution/history; denied actor cannot mutate.

Dependency or boundary: Add-person proof does not establish correction.

Roles retain dated tenure rather than current-title-only history.

Evidence: Examined gap or blocker remains in the supplied evidence. Reference: PE06; master line 637.

Examined ledger finding: dated roles: migration. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: P4: effective role start/end on person-funder associations.

Expected check: Former officer interaction shows historical role, not current staff status.

Dependency or boundary: No dated role tenure reported.

Public board/person extraction retains source evidence.

Evidence: Not examined in this run; current implementation unknown. Reference: PE11; master line 642.

Master work or verification: P4: retain reported 990 board lookup attribution.

Expected check: Imported board member links filing and source date; private note remains separate.

Dependency or boundary: Public board membership is not personal relationship evidence.

Contact extraction never implies friendship, influence, introduction willingness or permission to contact.

Evidence: Not examined in this run; current implementation unknown. Reference: PE12; master line 643.

Master work or verification: P4: evidence-kind labels and safe relationship assertions.

Expected check: Board-name match displays sourced role only, with no invented warm-introduction claim.

Dependency or boundary: No report proves inferred relationship semantics.

Relationship observations carry funder/program/round, source/date/period and direct-versus-inferred type.

Evidence: Not examined in this run; current implementation unknown. Reference: PE13; master line 644.

Master work or verification: P4: scoped observation records layered on current exchanges.

Expected check: Direct feedback and inferred preference on same round stay distinguishable and cited.

Dependency or boundary: Exchange existence alone does not establish typed evidence.

Conflicting/stale relationship observations stay inspectable and current priorities can be reconfirmed.

Evidence: Not examined in this run; current implementation unknown. Reference: PE14; master line 645.

Master work or verification: P4: append versioned observations and display uncertainty.

Expected check: Conflicting priorities do not silently replace each other; dated review resolves chosen scope.

Dependency or boundary: No relevant atom-level evidence.

Private notes never auto-promote into public funder intelligence.

Evidence: Not examined in this run; current implementation unknown. Reference: PE15; master line 646.

Master work or verification: P4/privacy: explicit visibility and promotion boundary, purpose checks.

Expected check: Private contact/feedback stays tenant-only after public identity refresh or merge.

Dependency or boundary: RLS tests are not proof of every promotion path.

Merge/split corrections preserve private provenance without copying notes into every public identity.

Evidence: Not examined in this run; current implementation unknown. Reference: PE16; master line 647.

Master work or verification: P4/discovery identity: maintain explicit links and reconciliation history.

Expected check: Funder rename/merge/split preserves note owner and intended link; no accidental disclosure.

Dependency or boundary: No report evidence for relationship merge/split.

Scoped contractor access applies to people/history and related links.

Evidence: Not examined in this run; current implementation unknown. Reference: PE17; master line 648.

Master work or verification: P4/identity: scope/expiry enforced at read and mutation.

Expected check: Contractor sees only assigned program/application relationship history; counts match.

Dependency or boundary: Membership scope/expiry absent; any member adds person.

No contacts/history, inaccessible history and failed save are distinct states.

Evidence: Reported whole implementation merged; acceptance remains. Reference: PE18; master line 649.

Master work or verification: P4: verify empty/error/permission UI and retain permitted failed input.

Expected check: Simulate read error and denied access; neither appears as empty/no history or saved.

Dependency or boundary: No relevant state tests supplied.

Funders, People and Organization remain reachable outside the core application loop.

Evidence: Examined and partial on the baseline; reconcile the gap. Reference: PE21; master line 652.

Examined ledger finding: Funders entry. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: P4/frontend: map existing People and organization routes before adding navigation.

Expected check: Navigate directly to each supporting area without Pursue or draft prerequisite.

Dependency or boundary: Separate Funders/People top-level navigation remains unresolved; no forced redesign.

Record dated funder interactions without requiring an application.

Evidence: Reported whole implementation merged; acceptance remains. Reference: PE07; master line 638.

Master work or verification: P4: preserve exchange logging by name/EIN; verify date fields.

Expected check: Log interaction before application and later inspect original dated event.

Dependency or boundary: Reachable exchange logging does not establish rich full-text search.

Search interaction history by person.

Evidence: Examined gap or blocker remains in the supplied evidence. Reference: PE08; master line 639.

Examined ledger finding: person link on exchanges: migration. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: P4: person-linked search over existing exchanges.

Expected check: Same person across funder/program exchanges can be retrieved within authorized scope.

Dependency or boundary: Current search by funder EIN only.

Search interaction history by date.

Evidence: Reported whole implementation merged; acceptance remains. Reference: PE09; master line 640.

Master work or verification: P4: date range filter on current history.

Expected check: Date interval returns correct permitted exchanges and excludes others.

Dependency or boundary: Current search by funder EIN only.

Group application history by funder and link authorized applications/cycles.

Evidence: Reported whole implementation merged; acceptance remains. Reference: PE10; master line 641.

Master work or verification: P4/lifecycle: verified funder links to existing application list.

Expected check: Several applications appear together under correct funder with cycle identity.

Dependency or boundary: Funder-EIN exchange search is not application-history grouping proof.

Connected content sources

Traceability group I01; integration.

Scope connection: Authorized connected-source intake is a surface of document/opportunity intake. One connected-source integration capability; least-scope access, revision tracking, cursor recovery and revocation are required properties, not separately counted features.

Evidence in this group: 7 unexamined in this run.

Connected content intake is limited to authorized locations and tracks source revisions/delta tokens. F §12B.

Evidence: Not examined in this run; current implementation unknown. Reference: FD120; master line 985.

Master work or verification: Connect scoped import only under chosen custody policy; verify reset/rescan behavior.

Expected check: Selected location only; lost token triggers scoped rescan, not whole-org crawl.

Selected connected storage can supply organization source documents.

Evidence: Not examined in this run; current implementation unknown. Reference: IN26; master line 544.

Master work or verification: P2 plus approved auth/deployment: connect retained read-only adapters through proxy/UI.

Expected check: Select authorized folder/file, import, reconnect and show truthful connection state.

Dependency or boundary: Adapters exist but switched off, unproxied, token provider test-only, buttons no handler.

Connected-source access is least-scope and limited to selected locations/accounts.

Evidence: Not examined in this run; current implementation unknown. Reference: IN27; master line 545.

Master work or verification: P2/privacy: establish scope/rights and source identifiers before enabling route.

Expected check: Out-of-scope file denied; selected file imported; grant/revoke correctly enforced.

Dependency or boundary: Current Drive readonly is restricted; broad scopes not proof of approved least privilege.

Connector tracks source identifiers, revisions and delta cursors.

Evidence: Not examined in this run; current implementation unknown. Reference: IN28; master line 546.

Master work or verification: P2: reuse delta/change mechanisms and verify revision mapping.

Expected check: Changed item updates observed revision without duplicate source; repeat event idempotent.

Dependency or boundary: Fake transports only; real-provider behavior unverified.

Expired connector cursors recover by scoped rescan, not organization-wide crawling.

Evidence: Not examined in this run; current implementation unknown. Reference: IN29; master line 547.

Master work or verification: P2: verify invalid-token branch, scoped rescan and dedup before adding code.

Expected check: Expired token reimports selected source range once, never expands authorized scope.

Dependency or boundary: Delta presence alone does not prove invalid-token recovery.

Source deletion in a connector does not silently erase retained history.

Evidence: Not examined in this run; current implementation unknown. Reference: IN30; master line 548.

Master work or verification: P2/privacy: reconcile scheduler DELETE with retention, source withdrawal and tombstones.

Expected check: Remote item removal preserves permitted history, marks source unavailable and stops future use.

Dependency or boundary: Scheduler DELETE reported; retention semantics not established.

Background connector access requires explicit credential custody, revocation and approved scope.

Evidence: Not examined in this run; current implementation unknown. Reference: IN37; master line 555.

Master work or verification: P2/identity: choose approved interactive versus background route; add secret storage only if authorized and required.

Expected check: Token revocation prevents next sync; expiration/reconnect is visible; no token is silently persisted.

Dependency or boundary: Per-request provider tokens exist; persistent refresh-token store is new. Do not assume connected storage grants standing access.

Track potential requested and awarded funding

Traceability group F24; capability.

Scope connection: Distinct dollar bases, deduplication and requestable amounts are one measurement capability.

Evidence in this group: 3 unexamined in this run.

Track strong-fit potential grant dollars per client and across clients.

Evidence: Not examined in this run; current implementation unknown. Reference: AW09; master line 345.

Master work or verification: Add these categories to existing measurement definitions/acceptance, with explicit authorized aggregation and no new public analytics product.

Expected check: A fixture produces per-client and authorized cross-client potential-dollar totals that reconcile to their constituent opportunity estimates. Definitions/thresholds remain open.

Potential-dollar metrics deduplicate opportunities and use realistic client-requestable amounts, not the funder's entire pool.

Evidence: Not examined in this run; current implementation unknown. Reference: AW10; master line 346.

Master work or verification: Reuse canonical opportunity/cycle identity and amount basis when aggregating the AW09 metric.

Expected check: Duplicate source mentions count once for the same client/opportunity/cycle; a large funder pool never becomes the individual client's available/requestable amount.

Keep potential, requested and awarded dollars separate in measurement.

Evidence: Not examined in this run; current implementation unknown. Reference: AW11; master line 347.

Master work or verification: Link opportunity potential, actual request and reported award as separate events/values; unknown awards remain unknown.

Expected check: One potential opportunity, submitted request and partial award produce distinct totals, not three counts of the same money; no awarded amount invented from submission.

Import organization documents and notes

Traceability group F28; capability.

Scope connection: One source-intake capability covering practical files, scanned/OCR content, pasted notes, transcripts and saved email. Types, uncertain extraction and retries are variants; uploaded provenance belongs to the same outcome. A distinct source-understanding transformation retaining original text; English output/UI remains the baseline.

Evidence in this group: 21 unexamined in this run; 5 pre-existing locally verified; 1 residual examined missing or blocked.

Collect legal/tax/990/incorporation/nonprofit status material as standard organization knowledge, without demanding it exists.

Evidence: Not examined in this run; current implementation unknown. Reference: IN01; master line 519.

Master work or verification: P2: verify coverage item, source storage and legal/tax/990/incorporation/nonprofit status classification; reuse existing coverage.

Expected check: Upload or mark missing legal/tax/990/incorporation/nonprofit status item; profile explains current coverage.

Dependency or boundary: Standard category is not mandatory onboarding gate.

Collect financial material as standard organization knowledge, without demanding it exists.

Evidence: Not examined in this run; current implementation unknown. Reference: IN02; master line 520.

Master work or verification: P2: verify coverage item, source storage and financial classification; reuse existing coverage.

Expected check: Upload or mark missing financial item; profile explains current coverage.

Dependency or boundary: Standard category is not mandatory onboarding gate.

Collect governance material as standard organization knowledge, without demanding it exists.

Evidence: Not examined in this run; current implementation unknown. Reference: IN03; master line 521.

Master work or verification: P2: verify coverage item, source storage and governance classification; reuse existing coverage.

Expected check: Upload or mark missing governance item; profile explains current coverage.

Dependency or boundary: Standard category is not mandatory onboarding gate.

Collect mission/strategy material as standard organization knowledge, without demanding it exists.

Evidence: Not examined in this run; current implementation unknown. Reference: IN04; master line 522.

Master work or verification: P2: verify coverage item, source storage and mission/strategy classification; reuse existing coverage.

Expected check: Upload or mark missing mission/strategy item; profile explains current coverage.

Dependency or boundary: Standard category is not mandatory onboarding gate.

Collect program material as standard organization knowledge, without demanding it exists.

Evidence: Not examined in this run; current implementation unknown. Reference: IN05; master line 523.

Master work or verification: P2: verify coverage item, source storage and program classification; reuse existing coverage.

Expected check: Upload or mark missing program item; profile explains current coverage.

Dependency or boundary: Standard category is not mandatory onboarding gate.

Collect prior proposal material as standard organization knowledge, without demanding it exists.

Evidence: Not examined in this run; current implementation unknown. Reference: IN06; master line 524.

Master work or verification: P2: verify coverage item, source storage and prior proposal classification; reuse existing coverage.

Expected check: Upload or mark missing prior proposal item; profile explains current coverage.

Dependency or boundary: Standard category is not mandatory onboarding gate.

Collect report material as standard organization knowledge, without demanding it exists.

Evidence: Not examined in this run; current implementation unknown. Reference: IN07; master line 525.

Master work or verification: P2: verify coverage item, source storage and report classification; reuse existing coverage.

Expected check: Upload or mark missing report item; profile explains current coverage.

Dependency or boundary: Standard category is not mandatory onboarding gate.

Collect writing/voice sample material as standard organization knowledge, without demanding it exists.

Evidence: Not examined in this run; current implementation unknown. Reference: IN08; master line 526.

Master work or verification: P2: verify coverage item, source storage and writing/voice sample classification; reuse existing coverage.

Expected check: Upload or mark missing writing/voice sample item; profile explains current coverage.

Dependency or boundary: Standard category is not mandatory onboarding gate.

Missing/nonapplicable records carry explanation and alternative evidence.

Evidence: Not examined in this run; current implementation unknown. Reference: IN09; master line 527.

Master work or verification: P2: not-applicable/alternate states on existing coverage records.

Expected check: No 990 plus incorporation proof is recorded honestly, without invented 990.

Dependency or boundary: No not-applicable or alternate-evidence answer found.

Accept and extract practical PDF uploads.

Evidence: Pre-existing behavior verified locally; acceptance remains. Reference: IN11; master line 529.

Master work or verification: P2: retain reported PDF parser; supply representative extraction evidence.

Expected check: PDF fixture stores original, locators and faithful parsed content; partial failure is labeled.

Dependency or boundary: File acceptance alone is not reliable understanding; no live parser run in report.

Accept and extract practical DOCX uploads.

Evidence: Pre-existing behavior verified locally; acceptance remains. Reference: IN12; master line 530.

Master work or verification: P2: retain reported DOCX parser; supply representative extraction evidence.

Expected check: DOCX fixture stores original, locators and faithful parsed content; partial failure is labeled.

Dependency or boundary: File acceptance alone is not reliable understanding; no live parser run in report.

Accept and extract practical XLSX uploads.

Evidence: Pre-existing behavior verified locally; acceptance remains. Reference: IN13; master line 531.

Master work or verification: P2: retain reported XLSX parser; supply representative extraction evidence.

Expected check: XLSX fixture stores original, locators and faithful parsed content; partial failure is labeled.

Dependency or boundary: File acceptance alone is not reliable understanding; no live parser run in report.

Accept and extract practical Markdown uploads.

Evidence: Pre-existing behavior verified locally; acceptance remains. Reference: IN14; master line 532.

Master work or verification: P2: retain reported Markdown parser; supply representative extraction evidence.

Expected check: Markdown fixture stores original, locators and faithful parsed content; partial failure is labeled.

Dependency or boundary: File acceptance alone is not reliable understanding; no live parser run in report.

Accept and extract practical plain text uploads.

Evidence: Pre-existing behavior verified locally; acceptance remains. Reference: IN15; master line 533.

Master work or verification: P2: retain reported plain text parser; supply representative extraction evidence.

Expected check: plain text fixture stores original, locators and faithful parsed content; partial failure is labeled.

Dependency or boundary: File acceptance alone is not reliable understanding; no live parser run in report.

Process scanned documents with OCR and honest limitations.

Evidence: Not examined in this run; current implementation unknown. Reference: IN16; master line 534.

Master work or verification: P2: verify OCR quality and whole-file Azure Document Intelligence route separately from Foundry.

Expected check: Synthetic scan produces located text; poor scan warns and offers correction/retry.

Dependency or boundary: Baseline identifies Azure Document Intelligence; earlier generic model wording is less precise. No live OCR test.

Disclose incomplete or uncertain extraction of tables and headers.

Evidence: Not examined in this run; current implementation unknown. Reference: IN17; master line 535.

Master work or verification: P2: test tables and headers; retain source and expose affected uncertainty, not generic success.

Expected check: Fixture with tables and headers shows what was extracted, omitted or uncertain.

Dependency or boundary: Broad GPT/Claude-like comprehension is quality target, not guarantee.

Disclose incomplete or uncertain extraction of spreadsheet formulas and budget units.

Evidence: Not examined in this run; current implementation unknown. Reference: IN18; master line 536.

Master work or verification: P2: test spreadsheet formulas and budget units; retain source and expose affected uncertainty, not generic success.

Expected check: Fixture with spreadsheet formulas and budget units shows what was extracted, omitted or uncertain.

Dependency or boundary: Broad GPT/Claude-like comprehension is quality target, not guarantee.

Disclose incomplete or uncertain extraction of embedded attachments and images.

Evidence: Not examined in this run; current implementation unknown. Reference: IN19; master line 537.

Master work or verification: P2: test embedded attachments and images; retain source and expose affected uncertainty, not generic success.

Expected check: Fixture with embedded attachments and images shows what was extracted, omitted or uncertain.

Dependency or boundary: Broad GPT/Claude-like comprehension is quality target, not guarantee.

Ask for and attribute a user description when image meaning is unclear.

Evidence: Not examined in this run; current implementation unknown. Reference: IN20; master line 538.

Master work or verification: P2/P3: as-described-by assertion preserving actor/source distinction.

Expected check: User-supplied image description appears as their assertion, not model-observed fact.

Dependency or boundary: Description attribution not found.

Failed/partial extraction retains original and offers retry or alternative format.

Evidence: Not examined in this run; current implementation unknown. Reference: IN21; master line 539.

Master work or verification: P2: verify retained original, error classification and retry/conversion UI.

Expected check: Unreadable upload stays accessible and retry does not duplicate accepted facts.

Dependency or boundary: Quarantine exists; whole recovery flow unproven.

Highly unusual formats may use a clearly explained conversion route.

Evidence: Not examined in this run; current implementation unknown. Reference: IN22; master line 540.

Master work or verification: P2: document actual supported types and bounded fallback after format evidence.

Expected check: Unsupported fixture gives conversion instructions without claiming extraction succeeded.

Dependency or boundary: No exhaustive format promise or arbitrary engineering effort approved.

Accept pasted notes as attributed organization inputs.

Evidence: Not examined in this run; current implementation unknown. Reference: IN23; master line 541.

Master work or verification: P2: trace pasted notes into organization source intake; reuse existing parser if suitable.

Expected check: pasted notes input receives source/author/date/scope and is selectable in profile evidence.

Dependency or boundary: Exchange .eml upload does not establish organization-knowledge ingestion.

Accept transcripts as attributed organization inputs.

Evidence: Not examined in this run; current implementation unknown. Reference: IN24; master line 542.

Master work or verification: P2: trace transcripts into organization source intake; reuse existing parser if suitable.

Expected check: transcripts input receives source/author/date/scope and is selectable in profile evidence.

Dependency or boundary: Exchange .eml upload does not establish organization-knowledge ingestion.

Accept saved emails as attributed organization inputs.

Evidence: Not examined in this run; current implementation unknown. Reference: IN25; master line 543.

Master work or verification: P2: trace saved emails into organization source intake; reuse existing parser if suitable.

Expected check: saved emails input receives source/author/date/scope and is selectable in profile evidence.

Dependency or boundary: Exchange .eml upload does not establish organization-knowledge ingestion.

English UI accepts translated non-English source material.

Evidence: Examined gap or blocker remains in the supplied evidence. Reference: ON29; master line 496.

Examined ledger finding: needs a paid model/translation provider (OUT). Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: P2: source-language detection/translation on approved route, retain original.

Expected check: Non-English source produces marked translation, accessible original and honest uncertainty.

Dependency or boundary: Translation coverage/provider require evidence; not multilingual UI.

Original uploads retain owner, visibility, source date, batch and hash.

Evidence: Not examined in this run; current implementation unknown. Reference: IN32; master line 550.

Master work or verification: P2: verify each provenance attribute on intake and downstream references.

Expected check: Imported file can be traced to original owner/date/batch/checksum without cross-tenant lookup.

Dependency or boundary: Dates verified in code report; remaining metadata not atomically evidenced.

Non-English sources can be translated for English UI/drafting with retained original. Q12; PG §23

Evidence: Not examined in this run; current implementation unknown. Reference: DR34; master line 1396.

Master work or verification: Ingestion translation with provenance and approved processing route

Expected check: non-English source-to-English answer trace

Dependency or boundary: FACT/RUN

Handle source files safely and preserve custody

Traceability group S06; safeguard.

Scope connection: Validation, malware/size checks, parser isolation, original/derived custody, rights and retention protect all source intake and reuse; not independent user-facing features.

Evidence in this group: 4 unexamined in this run; 2 pre-existing locally verified; 1 residual examined missing or blocked.

Uploads use validation/quarantine and safe handling of unsupported content.

Evidence: Not examined in this run; current implementation unknown. Reference: IN33; master line 551.

Master work or verification: P2: reuse quarantine; verify file-type, malware, size and preview handling.

Expected check: Unsafe/unsupported fixture isolated and no false usable-fact claim.

Dependency or boundary: Quarantine is reported; malware/expanded-size/preview controls not separately proven.

Upload custody distinguishes original bytes from derived text/index and accepted facts.

Evidence: Not examined in this run; current implementation unknown. Reference: IN36; master line 554.

Master work or verification: P2/platform: decide custody before altering storage; map current copies and derivative lineage.

Expected check: Evidence separately identifies original share, knowledge.db text/index, Postgres accepted facts and runs.db checkpoints under selected approved custody policy.

Dependency or boundary: Current originals and derived data are Centring-held per-organization storage. Reference-only/derived-only mode is not built or approved.

Identify actual file type rather than trust extension.

Evidence: Pre-existing behavior verified locally; acceptance remains. Reference: IN38; master line 556.

Master work or verification: P2: verify existing byte-based type validation; patch only demonstrated gaps.

Expected check: Renamed executable/mismatched signature does not enter normal parser or false successful state.

Dependency or boundary: Quarantine does not prove byte-based identification.

Scan uploads for malicious content before active use.

Evidence: Not examined in this run; current implementation unknown. Reference: IN39; master line 557.

Master work or verification: P2/security: verify current malware scan and safe pending/blocked outcome.

Expected check: Benign scanner fixture and supported test signature show correctly held/released content.

Dependency or boundary: No live malware scan evidence supplied.

Enforce compressed and expanded file-size limits.

Evidence: Pre-existing behavior verified locally; acceptance remains. Reference: IN40; master line 558.

Master work or verification: P2/security: establish measured allowed limits, enforce decompression bounds.

Expected check: Synthetic oversized/expansion fixture stops safely and retains truthful error.

Dependency or boundary: No numerical size policy is invented.

Isolate risky parsers and remove active content from previews.

Evidence: Not examined in this run; current implementation unknown. Reference: IN41; master line 559.

Master work or verification: P2/security: inspect parser isolation and preview sanitization before changing mechanisms.

Expected check: Active-content fixture cannot run in preview; parser failure cannot damage retained source corpus.

Dependency or boundary: Quarantine alone does not prove parser process isolation or sanitization.

Preserve source rights/privacy/retention boundaries on original and derived material.

Evidence: Examined gap or blocker remains in the supplied evidence. Reference: SO28; master line 592.

Examined ledger finding: row: lawful per-class retention not decided. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: Policy/P2: decide lawful per-class retention/rights then enforce source and derivative deletion.

Expected check: Policy-approved fixture traces original, derived copies and any hold without false zero-retention claim.

Dependency or boundary: L is legal/provider research, not product verification or approved numeric policy.

Review and select authoritative knowledge for drafting

Traceability group F29; capability.

Scope connection: The user reviews an editable learned-summary and adopts sourced facts without promoting historical or uncertain material automatically. One scoped evidence-selection/authority capability; periods, provenance, conflicts, fact types and immutable passages are its required dimensions.

Evidence in this group: 12 unexamined in this run; 2 examined baseline partial; 1 whole merged.

Map imported rows and review extracted facts before current adoption.

Evidence: Not examined in this run; current implementation unknown. Reference: IN34; master line 552.

Master work or verification: P2/P3: row review and mapping over existing XLSX extraction.

Expected check: User corrects row/column mapping; only chosen facts become current with period/source.

Dependency or boundary: XLSX parsing is not structured financial import.

Historical drafts/projections/budgets remain historical or unverified until scoped confirmation.

Evidence: Not examined in this run; current implementation unknown. Reference: IN35; master line 553.

Master work or verification: P3: retain temporal/status type through profile and drafting retrieval.

Expected check: Old proposed budget does not become achieved/received/current merely on upload.

Dependency or boundary: Adopted-forecast labeling in later drafts unknown.

Editable sectioned What Beedy learned profile/program summary.

Evidence: Examined and partial on the baseline; reconcile the gap. Reference: SO01; master line 565.

Examined ledger finding: no source/history per fact (ON11; history = capped JSON list, no migration). Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: P3: expose versioned facts through existing profile, not a duplicate knowledge store.

Expected check: Edit a learned fact in its section, reload, and inspect source/history.

Dependency or boundary: No user-editable sectioned knowledge route found.

Every claimed known fact links to supporting source.

Evidence: Examined and partial on the baseline; reconcile the gap. Reference: SO02; master line 566.

Examined ledger finding: profile facts show no source (ON11). Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: P3: trace assembled profile context through actual Loom prompt consumption and unify authority/locators only where needed.

Expected check: Select each displayed fact and inspect exact source/passage or attributed manual assertion.

Dependency or boundary: A/M11 says profile facts absent, while B152-156 says profile/program context is assembled and pushed. Effective fact/prompt consumption is unresolved, not blanket missing.

Selected organization profile facts reach drafting with provenance. PG S11; D §6A

Evidence: Reported whole implementation merged; acceptance remains. Reference: EV01; master line 1404.

Master work or verification: Trace payload through Loom to actual model consumption; avoid second authority

Expected check: changed profile-to-draft trace

Dependency or boundary: FACT/RUN

Retrieval is scoped to organization plus selected program, with optional other-program inclusion. Q31; PG S11/S19

Evidence: Not examined in this run; current implementation unknown. Reference: EV02; master line 1405.

Master work or verification: Enforce selected scope end to end and make it visible

Expected check: two-program canaries PT07

Dependency or boundary: FACT/ID

Retrieval respects applicable fiscal period/date, not simply newest upload. D §6A; Q30/31

Evidence: Not examined in this run; current implementation unknown. Reference: EV03; master line 1406.

Master work or verification: Scope inputs and preserve concurrent valid fiscal periods

Expected check: conflicting-year fixture T03/T06

Dependency or boundary: FACT

Facts carry value, unit, period and source. D §4/6A

Evidence: Not examined in this run; current implementation unknown. Reference: EV04; master line 1407.

Master work or verification: Verify full round trip on candidate; avoid reverting errata correction

Expected check: typed edit dependency proof

Dependency or boundary: FACT/DOC

Compare only matching entity/program/metric/denominator/accounting basis before declaring conflict. D §6A

Evidence: Not examined in this run; current implementation unknown. Reference: EV05; master line 1408.

Master work or verification: Verify or extend exact scope semantics, not newest-wins heuristic

Expected check: same-number/different-basis T03/T06

Dependency or boundary: FACT

Retain competing assertions and let authorized human choose scoped authority. D §6A; PG S11

Evidence: Not examined in this run; current implementation unknown. Reference: EV06; master line 1409.

Master work or verification: Expose scoped authority choice and retain alternatives/history

Expected check: one app changes while historical app stays valid

Dependency or boundary: FACT/ID

Upload alone never chooses authority or rewrites adopted application. D §6A/C; Q30

Evidence: Not examined in this run; current implementation unknown. Reference: EV07; master line 1410.

Master work or verification: Replacement comparison before adoption; preserve text

Expected check: newer conflicting upload leaves adopted draft unchanged

Dependency or boundary: FACT/REV

Distinguish source fact, user report, calculation, estimate and commitment. D §6A; PG S11

Evidence: Not examined in this run; current implementation unknown. Reference: EV08; master line 1411.

Master work or verification: Preserve type through context, prose support and export

Expected check: forecast cannot become secured fact

Dependency or boundary: FACT/DOC

Human confirmation is not independent verification, arithmetic correctness or internal approval. D §6A; PG V13

Evidence: Not examined in this run; current implementation unknown. Reference: EV09; master line 1412.

Master work or verification: Verify distinct support/attestation/approval labels and stores

Expected check: unsupported-attested pair PT10

Dependency or boundary: FACT/REV

Each source/passage retains origin/date/rights/version/excerpt/locator. D §6A

Evidence: Not examined in this run; current implementation unknown. Reference: EV10; master line 1413.

Master work or verification: Inventory source versus question locators; add missing exact linkage

Expected check: clickable passage/version trace

Dependency or boundary: FACT/ID

Replacing source content creates new passage identity, not new bytes under old citation. D §6A

Evidence: Not examined in this run; current implementation unknown. Reference: EV11; master line 1414.

Master work or verification: Verify immutable source-version/passage identity

Expected check: source replacement hash/locator fixture

Dependency or boundary: FACT

Classify and select organization/program sources

Traceability group F30; capability.

Scope connection: Source scope assignment, reclassification and chosen organization/program context yield the same reusable knowledge-selection outcome. Actual drafting consumption is an acceptance requirement.

Evidence in this group: 1 pre-existing locally verified; 6 examined baseline partial.

Preserve organization-wide source scope.

Evidence: Pre-existing behavior verified locally; acceptance remains. Reference: SO03; master line 567.

Master work or verification: P2/P3: reuse scope store and test retrieval consumption.

Expected check: Organization source available in permitted program drafting without duplicate upload.

Dependency or boundary: Stored scope is not proof that retrieval honors it.

Preserve program-specific and multi-program/shared tags.

Evidence: Examined and partial on the baseline; reconcile the gap. Reference: SO04; master line 568.

Examined ledger finding: drafting never selects a program: needs application->program link (PR01, migration). Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: P2/P3: verify multi-tag capability and selected program retrieval.

Expected check: Shared source supports selected programs; unrelated program source excluded.

Dependency or boundary: Report confirms program tagging, not every multi-tag use.

Drag/drop reclassification changes source scope.

Evidence: Examined and partial on the baseline; reconcile the gap. Reference: SO05; master line 569.

Examined ledger finding: no One API route or web control (route + two-tenant + role tests). Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: P2: connect retag route to approved drag/drop, with permission and save state.

Expected check: Drag source to other program, reload; old/new scope recorded, denied move does not lie.

Dependency or boundary: Retag API exists; drag/drop interaction not demonstrated.

Current organization/program scope is always visible.

Evidence: Examined and partial on the baseline; reconcile the gap. Reference: SO06; master line 570.

Examined ledger finding: drafting view does not show the scope a run reads. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: P2/P3: verify scope indicator in library and drafting views.

Expected check: User can identify selected scope before upload/draft/reclassification.

Dependency or boundary: Do not invent colors/emoji scheme as a requirement.

General-operating work can use organization context and all programs.

Evidence: Examined and partial on the baseline; reconcile the gap. Reference: SO07; master line 571.

Examined ledger finding: no explicit general-operating mode with attribution. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: P3: explicit general-operating retrieval mode with attribution.

Expected check: General-operating fixture retrieves relevant cross-program evidence without flattening identity.

Dependency or boundary: Whole-organization retrieval currently exists but is not purpose-scoped correctness.

Program drafting uses core organization plus selected program; other programs optional.

Evidence: Examined and partial on the baseline; reconcile the gap. Reference: SO08; master line 572.

Examined ledger finding: as SO04 + period filter. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: P3: scoped retrieval/filter on program and period; user can deliberately include another program.

Expected check: Two-program fixture excludes unrelated figures, then includes selected additional evidence.

Dependency or boundary: Current retrieval spans whole organization and ignores dates.

Profile/program/budget context assembly and effective drafting consumption must be evidenced separately.

Evidence: Examined and partial on the baseline; reconcile the gap. Reference: SO32; master line 596.

Examined ledger finding: wrong program/period not excluded (SO08); no profile-only figure traced into facts_used. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: P3: authorized trace from Postgres profile through routes_loom payload, Loom input parsing, prompt assembly, retrieval, generated claim and facts_used; do not rebuild assembly blindly.

Expected check: Synthetic distinctive profile-only fact appears correctly and with provenance in consumed prompt/output/facts_used; wrong program/period excluded.

Dependency or boundary: B says context is built and pushed, A still says profile facts absent. Neither proves effective structured fact consumption; explicit contradiction retained.

Manage document versions and applicable periods

Traceability group F31; capability.

Scope connection: Document replacement, duplicate handling, source authority, date/period coexistence and stale-source review form source/version maintenance.

Evidence in this group: 2 whole merged; 5 examined baseline partial; 2 residual examined missing or blocked.

Intrinsic document date is distinct from upload date.

Evidence: Reported whole implementation merged; acceptance remains. Reference: SO09; master line 573.

Master work or verification: P2: preserve as_of versus ingested_at through UI/export.

Expected check: Old fiscal document uploaded today displays both dates distinctly.

Dependency or boundary: Neither date alone establishes authority.

Concurrent valid fiscal-period documents coexist; ask whether an older document remains applicable to an active grant when relevance is uncertain.

Evidence: Examined and partial on the baseline; reconcile the gap. Reference: SO10; master line 574.

Examined ledger finding: no question whether an older period's document still applies. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: P2/P3: preserve dated source versions and period-aware use; verify the relevance clarification.

Expected check: Three-year grant can use earlier still-valid budget without replacing current-year budget; uncertain applicability prompts the user.

Dependency or boundary: Coexistence reported connected; correct retrieval and clarification remain unverified.

Similar/same-name upload asks revision, other period/program or additional evidence.

Evidence: Examined gap or blocker remains in the supplied evidence. Reference: SO11; master line 575.

Examined ledger finding: prompt: revision, other period/program, or additional. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: P2: explicit duplicate-purpose prompt before write/adoption.

Expected check: Upload same name; replacement/new period/additional choices do not silently overwrite.

Dependency or boundary: Duplicate-name handling not found.

Duplicate-identical upload can cancel or rename as different document.

Evidence: Examined and partial on the baseline; reconcile the gap. Reference: SO12; master line 576.

Examined ledger finding: no cancel / rename-as-different branch. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: P2: include cancel/different-document branch after byte/name match.

Expected check: Cancel leaves no duplicate; rename preserves original and intended distinct item.

Dependency or boundary: Report proposes three upload-purpose choices but does not assess cancel/rename atom.

Replacement keeps accessible version history.

Evidence: Examined and partial on the baseline; reconcile the gap. Reference: SO13; master line 577.

Examined ledger finding: keep old versions readable: vault change + retention rule. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: P2: expose prior revisions and verify retained readable bytes under policy.

Expected check: Open previous version after confirmed replacement and trace associated facts.

Dependency or boundary: New-version filing retention reported; old readable version explicitly unknown.

Same-scope authority is user chosen; latest upload is not universal authority.

Evidence: Examined and partial on the baseline; reconcile the gap. Reference: SO14; master line 578.

Examined ledger finding: the model picks, not the person. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: P3: explicit source authority selection among same-scope alternatives.

Expected check: Two same-period conflicting sources remain inspectable until choice; newer upload alone changes nothing adopted.

Dependency or boundary: Q30 newest-confirmed-replacement must not become latest-upload-wins.

Stale source prompts review, replacement or confirmation, not blanket annual expiry.

Evidence: Examined gap or blocker remains in the supplied evidence. Reference: SO15; master line 579.

Examined ledger finding: review/confirm state per document on SO19 dates. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: P2: implement/verify date-aware maintenance state without invented expiry.

Expected check: User confirms old but still-valid record; it remains usable and confirmation dated.

Dependency or boundary: Document reminders user-chosen; overview six-month prompt is different.

Organization owns source maintenance; removal/replacement uses assigned permissions.

Evidence: Examined and partial on the baseline; reconcile the gap. Reference: SO16; master line 580.

Examined ledger finding: no source-maintainer grant. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: P2/identity: verify source action capabilities rather than hardcoded all-users/role assumption.

Expected check: Authorized source maintainer replaces; ordinary user without grant denied.

Dependency or boundary: No atom-level source-removal permission evidence; reviewer/owner titles cannot substitute for grants.

New uploads visible and sortable by newest/name; accidental uploads removable.

Evidence: Reported whole implementation merged; acceptance remains. Reference: SO20; master line 584.

Master work or verification: P2: verify current list sort/visibility and permissioned removal UI.

Expected check: New file appears promptly; sort and remove accidental upload without disturbing others.

Dependency or boundary: Context-menu shape accepted as option, not reason to build a separate browser.

Withdraw a source safely

Traceability group F32; capability.

Scope connection: User removes source support while preserving draft text, showing warnings and stopping future reuse; derived-fact consequences are part of the same action. Maintain drafts while preventing withdrawn evidence from guiding new text and showing source changes. This is source lifecycle behavior, not deletion of the draft. Withdrawal consequences belong to source lifecycle, including preserved draft text and independently supported facts. Merge with knowledge source management.

Evidence in this group: 4 examined baseline partial; 1 pre-existing locally verified; 7 unexamined in this run.

Deleting a source preserves existing draft text.

Evidence: Examined and partial on the baseline; reconcile the gap. Reference: SO21; master line 585.

Examined ledger finding: test-only; note Loom withholds such an answer from the printed narrative (LT map633). Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: P2/P3: preserve text while adding missing withdrawal warnings.

Expected check: Delete cited source; accepted answer text remains byte-equivalent.

Dependency or boundary: Untouched quotes are not a complete deletion-impact implementation.

Deleted source creates prominent warning with original filename and update/replacement prompt.

Evidence: Examined and partial on the baseline; reconcile the gap. Reference: SO22; master line 586.

Examined ledger finding: no original filename kept; accepted answers get no warning (Loom column). Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: P3: dependency invalidation and filename tombstone on affected answers.

Expected check: Deleted named source visibly flags every dependent answer without changing prose.

Dependency or boundary: No warning reported; user-visible filename history unknown.

Deleted source passages stop future drafting/reuse.

Evidence: Pre-existing behavior verified locally; acceptance remains. Reference: SO23; master line 587.

Master work or verification: P3: retain tested exclusion and regression on current connected path.

Expected check: New draft/reuse after withdrawal does not quote deleted document.

Dependency or boundary: Reported local tests, not production proof.

Deleted source-linked derived facts stop future use.

Evidence: Examined and partial on the baseline; reconcile the gap. Reference: SO24; master line 588.

Examined ledger finding: facts_used links not invalidated; no delete-then-/facts test. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: P3: connect derivation lineage to withdrawal; invalidate stale fact-use dependencies.

Expected check: Future drafting excludes only facts solely supported by withdrawn source.

Dependency or boundary: Deletion leaves record fact links untouched; passage exclusion alone insufficient.

Independently sourced support for same value is not purged by inference.

Evidence: Examined and partial on the baseline; reconcile the gap. Reference: SO25; master line 589.

Examined ledger finding: test-only: delete one, the other's fact stands. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: P3: retain evidence edges individually and recompute remaining support.

Expected check: Delete one of two supporting documents; independent supported fact remains with surviving source.

Dependency or boundary: No atom-level proof in reports.

Deleting source preserves written draft text and warns with original filename/deleted status. Q32; PG S11/PT07

Evidence: Not examined in this run; current implementation unknown. Reference: EV38; master line 1441.

Master work or verification: Mark affected support, keep filename, prompt replacement without rewriting text

Expected check: deletion fixture exact draft equality plus warning

Dependency or boundary: FACT/DOC

Deleted source and its derived facts cannot guide future drafting. Q32; PG S11

Evidence: Not examined in this run; current implementation unknown. Reference: EV39; master line 1442.

Master work or verification: Trace all derived-fact contexts, not just passage fetch

Expected check: distinctive source-fact canary T23

Dependency or boundary: FACT/RUN

Deletion does not purge independently supported equivalent facts by inference. Q32; PG S11

Evidence: Not examined in this run; current implementation unknown. Reference: EV40; master line 1443.

Master work or verification: Recompute support per source edge, retain legitimate independent support

Expected check: two-source/single-deletion fixture

Dependency or boundary: FACT

Every excerpt, link and derived snippet obeys current source access. D §14A; PG S11

Evidence: Not examined in this run; current implementation unknown. Reference: EV41; master line 1444.

Master work or verification: Check source-use/audience at host write, not merely page access

Expected check: shared-document and revoked-source T17

Dependency or boundary: ID/FACT/HOST

Withdrawal immediately stops future use even when lawful retention preserves physical bytes.

Evidence: Not examined in this run; current implementation unknown. Reference: RET-006; master line 2003.

Master work or verification: Fence derived facts/support separately from physical erasure.

Expected check: Source withdrawal prevents new use, existing written text retained with warning.

Deleting a source keeps existing draft text unchanged and prominently warns with original filename.

Evidence: Not examined in this run; current implementation unknown. Reference: RET-007; master line 2004.

Master work or verification: Retain minimal permitted identifying history and affected-answer links.

Expected check: Existing text unchanged; warning locates deleted source and prompts update/replacement.

Deleted-source derived facts become inactive without purging independently supported facts by inference.

Evidence: Not examined in this run; current implementation unknown. Reference: RET-008; master line 2005.

Master work or verification: Status in version dependency; preserve alternative support lineage.

Expected check: Same fact with independent source remains usable; withdrawn-only lineage does not.

Apply fact corrections to selected applications

Traceability group F33; capability.

Scope connection: Choose local versus reusable correction, preview affected applications, and adopt updates selectively without rewriting submitted snapshots. Shared-source preservation is a lifecycle boundary, not another feature.

Evidence in this group: 3 examined baseline partial; 2 residual examined missing or blocked; 1 unexamined in this run.

Source/fact changes flag affected draft values without silently rewriting adopted applications.

Evidence: Examined and partial on the baseline; reconcile the gap. Reference: SO26; master line 590.

Examined ledger finding: status-only change and source deletion mark nothing stale. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: P3: retain value/unit/period invalidation; add source and status changes.

Expected check: Core figure changes; affected locations warn, human prose stays until accepted proposal.

Dependency or boundary: Status-only change triggers no staleness; source deletion no warnings.

Application deletion preserves shared organization sources and other-used records.

Evidence: Examined gap or blocker remains in the supplied evidence. Reference: SO27; master line 591.

Examined ledger finding: D-07. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: Lifecycle/P2: reference ownership checks before application-only delete.

Expected check: Delete one application, then read same shared source from another application and organization.

Dependency or boundary: A245 calls safeguard proposed; V26 later makes it decided. No application-delete route reported.

Reusable fact correction offers application-only versus organization update.

Evidence: Examined gap or blocker remains in the supplied evidence. Reference: SO29; master line 593.

Examined ledger finding: row says assessment could not call it missing; absent at main. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: P3: trace existing revision route and expose explicit correction scope.

Expected check: Correct one application figure and verify organization/other applications unchanged unless organization update selected.

Dependency or boundary: Assessment explicitly says this choice is unknown; do not call it missing.

Organization fact update presents affected unsubmitted applications for selected adoption.

Evidence: Examined and partial on the baseline; reconcile the gap. Reference: SO30; master line 594.

Examined ledger finding: no list of affected unsubmitted applications to choose from. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: P3/application dependency: selected-target impact list and per-application revision guards.

Expected check: Choose one of two unsubmitted applications; only selected version updates with attribution.

Dependency or boundary: Fact staleness is not selected application adoption.

Organization fact correction never rewrites submitted snapshots.

Evidence: Examined and partial on the baseline; reconcile the gap. Reference: SO31; master line 595.

Examined ledger finding: test-only: change the profile after sending; copy byte-equal. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: P3/lifecycle: retain immutable submitted-copy behavior while adding correction choices.

Expected check: Update shared organization fact and compare preserved submitted bytes/versions.

Dependency or boundary: Reported test test_qual_2_a_sent_application_stays_as_sent.py supports precise snapshot invariant, not all profile paths.

Source changes issue notices; immutable discovery handoff never silently changes adopted draft. F §12C; PG S09/S10

Evidence: Not examined in this run; current implementation unknown. Reference: EV42; master line 1445.

Master work or verification: Versioned handoff/change receipt with deliberate adoption

Expected check: handoff then rule-change T13/F

Dependency or boundary: REQ/FACT

Develop and reuse a living program plan

Traceability group F34; capability.

Scope connection: A persistent editable program combines interview/manual/import/research input, proposed versus observed facts, timeline/history, team and capacity gaps. Individual fields and data-entry routes are not counted separately.

Evidence in this group: 5 examined baseline partial; 1 residual examined missing or blocked; 1 pre-existing locally verified; 10 whole merged; 3 unexamined in this run; 1 partial merged.

Grant browser and collaborative interview are entrances to one persistent program record.

Evidence: Examined and partial on the baseline; reconcile the gap. Reference: PR01; master line 602.

Examined ledger finding: see EVIDENCE/PR. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: P3: join existing program profile and application-guidance primitives, no second program store.

Expected check: Enter from browse and interview; same program identity/history appears.

Dependency or boundary: Application guided start is not program interview.

Program interview supports experienced staff as well as novices.

Evidence: Examined gap or blocker remains in the supplied evidence. Reference: PR02; master line 603.

Examined ledger finding: program interview. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: P3: program-development interview accessible independent of guidance level.

Expected check: Expert creates new program by interview; novice and direct-edit routes use same record.

Dependency or boundary: No program interview/chat entry reported.

Program remains editable and reusable, not a static description form.

Evidence: Pre-existing behavior verified locally; acceptance remains. Reference: PR03; master line 604.

Master work or verification: P3: extend existing editable profile with structured versioned facts.

Expected check: Update program, reopen from another application, and inspect old revisions.

Dependency or boundary: Director-editable text exists; structured living repository incomplete.

Program retains editable activities with evidence and temporal meaning.

Evidence: Reported whole implementation merged; acceptance remains. Reference: PR04; master line 605.

Master work or verification: P3: verify structured activities mapping; add versioned fact only if absent.

Expected check: Edit activities, inspect source/history and retrieve correct period in application.

Dependency or boundary: Editable narrative alone does not establish distinct field provenance/history.

Program retains editable community served with evidence and temporal meaning.

Evidence: Reported whole implementation merged; acceptance remains. Reference: PR05; master line 606.

Master work or verification: P3: verify structured community served mapping; add versioned fact only if absent.

Expected check: Edit community served, inspect source/history and retrieve correct period in application.

Dependency or boundary: Editable narrative alone does not establish distinct field provenance/history.

Program retains editable geography with evidence and temporal meaning.

Evidence: Reported whole implementation merged; acceptance remains. Reference: PR06; master line 607.

Master work or verification: P3: verify structured geography mapping; add versioned fact only if absent.

Expected check: Edit geography, inspect source/history and retrieve correct period in application.

Dependency or boundary: Editable narrative alone does not establish distinct field provenance/history.

Program retains editable scale with evidence and temporal meaning.

Evidence: Reported whole implementation merged; acceptance remains. Reference: PR07; master line 608.

Master work or verification: P3: verify structured scale mapping; add versioned fact only if absent.

Expected check: Edit scale, inspect source/history and retrieve correct period in application.

Dependency or boundary: Editable narrative alone does not establish distinct field provenance/history.

Program retains editable costs with evidence and temporal meaning.

Evidence: Reported whole implementation merged; acceptance remains. Reference: PR08; master line 609.

Master work or verification: P3: verify structured costs mapping; add versioned fact only if absent.

Expected check: Edit costs, inspect source/history and retrieve correct period in application.

Dependency or boundary: Editable narrative alone does not establish distinct field provenance/history.

Program retains editable timing with evidence and temporal meaning.

Evidence: Reported whole implementation merged; acceptance remains. Reference: PR09; master line 610.

Master work or verification: P3: verify structured timing mapping; add versioned fact only if absent.

Expected check: Edit timing, inspect source/history and retrieve correct period in application.

Dependency or boundary: Editable narrative alone does not establish distinct field provenance/history.

Program retains editable results with evidence and temporal meaning.

Evidence: Reported whole implementation merged; acceptance remains. Reference: PR10; master line 611.

Master work or verification: P3: verify structured results mapping; add versioned fact only if absent.

Expected check: Edit results, inspect source/history and retrieve correct period in application.

Dependency or boundary: Editable narrative alone does not establish distinct field provenance/history.

Program retains documents/flyers and history.

Evidence: Examined and partial on the baseline; reconcile the gap. Reference: PR11; master line 612.

Examined ledger finding: see EVIDENCE/PR. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: P2/P3: reuse tagged documents/report folders and attach versions to program.

Expected check: Program document and prior version remain discoverable by scope and date.

Dependency or boundary: Tagged documents exist; complete living-history evidence absent.

Manual and document/XLSX input both populate correctable program data.

Evidence: Examined and partial on the baseline; reconcile the gap. Reference: PR12; master line 613.

Examined ledger finding: see EVIDENCE/PR. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: P2/P3: structured import with manual correction over facts/version layer.

Expected check: Import spreadsheet then correct field manually; new revision/source/actor retained.

Dependency or boundary: Vault extraction is not financial/impact record import.

Cited research can fill program gaps for user review.

Evidence: Not examined in this run; current implementation unknown. Reference: PR13; master line 614.

Master work or verification: P3/research: source-backed proposed facts, explicit acceptance.

Expected check: Research-filled value stays proposed until chosen and links source.

Dependency or boundary: Do not assume application assistant already writes program facts.

Proposed program details remain distinct from agreed/observed facts.

Evidence: Reported whole implementation merged; acceptance remains. Reference: PR19; master line 620.

Master work or verification: P3: preserve tentative/proposed/adopted/observed types through drafting.

Expected check: Accepted plan future attendance still labeled target, never achieved history.

Dependency or boundary: Forecast labeling downstream explicitly unknown.

Tentative ranges/estimates support exploratory work without rigid plan-acceptance gate.

Evidence: Only part merged; finish the residual and accept. Reference: PR20; master line 621.

Master work or verification: P3: preserve gap-tolerant draft route; clarify only material changing unknowns.

Expected check: Incomplete program can explore while uncertainty remains explicit.

Dependency or boundary: Earlier Q35 pre-draft adoption language does not restore mandatory internal-plan gate.

Program status/timeline preserves past changes and correct tense.

Evidence: Reported whole implementation merged; acceptance remains. Reference: PR21; master line 622.

Master work or verification: P3: verify existing lifecycle/history; retain provisional status taxonomy.

Expected check: Expansion and paused/active dates preserve earlier program state and tense.

Dependency or boundary: Q36 proposed/new/active/paused/completed labels are provisional, not finalized taxonomy.

Leaders prior work is attributed to individual/prior role, not new organization history.

Evidence: Examined and partial on the baseline; reconcile the gap. Reference: PR22; master line 623.

Examined ledger finding: see EVIDENCE/PR. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: P3: actor/organization/period attribution in claims and draft context.

Expected check: Founder experience fixture cannot become organization achieved outcomes.

Dependency or boundary: No relevant atom-level report test.

Submitted proposal can suggest profile updates but is not award evidence or automatic overwrite.

Evidence: Examined and partial on the baseline; reconcile the gap. Reference: PR23; master line 624.

Examined ledger finding: see EVIDENCE/PR. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: P3/lifecycle: proposal source type and optional program-vs-funder-specific adoption.

Expected check: Submitted plan suggests update; user declines; program unchanged and no award recorded.

Dependency or boundary: Submitted/awarded separate, but profile-adoption path unverified.

Living program record retains editable team/delivery-role information with source and historical context. Q34, WB446 (recorded answer includes “costs, team, results”); DEC469-475 records the broader living repository and bounded tracking approval.

Evidence: Reported whole implementation merged; acceptance remains. Reference: PR26; master line 314.

Master work or verification: Verify existing program field mapping; connect team/role facts with period/source only where absent, using the same record rather than a new HR system.

Expected check: Update who delivers a program; current role and prior period remain source-attributed, and another program's staffing is not silently reused.

Organizational size alone must not rule out a scaling grant; ask how planned capacity will expand and surface concrete evidence-backed gaps. Q39, DEC495; WB504.

Evidence: Not examined in this run; current implementation unknown. Reference: PR27; master line 315.

Master work or verification: Distinguish a genuine source-backed applicant-size criterion from an assumed capacity ceiling; preserve human choice and planned-versus-existing resources.

Expected check: Small nonprofit seeks a large eligible expansion award: no automatic exclusion based solely on current size; ask scaling plan and show concrete staffing/budget gaps. Explicit actual funder cap remains a sourced warning, not silently waived.

Current organizational size is not by itself a ceiling on award ambition; an award may fund new staff/capacity, so ask how the organization will scale.

Evidence: Not examined in this run; current implementation unknown. Reference: AW14; master line 349.

Master work or verification: Link growth-funded capacity assumptions and evidence to eligibility/ranking and planning; do not create an arbitrary size-to-award threshold.

Expected check: A small nonprofit pursuing an eligible capacity-building award remains visible and explorable; the system asks about recruitment/delivery capacity and flags concrete unsupported assumptions rather than rejecting the award merely because it is large.

Record and summarize program funding and results

Traceability group F35; capability.

Scope connection: Bounded awards, donations, attendance and impact records with dates/provenance, import deduplication and summaries. Record-type variants do not imply advanced accounting.

Evidence in this group: 1 examined baseline partial; 2 whole merged; 2 unexamined in this run.

Awards, donations, attendance and impact remain separate meaningful record types.

Evidence: Examined and partial on the baseline; reconcile the gap. Reference: PR14; master line 615.

Examined ledger finding: see EVIDENCE/PR. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: P3/P5: bounded typed entries, dates/sources and simple summaries.

Expected check: One fixture with all four types reports each correctly without summing unlike units.

Dependency or boundary: No tracked figures with history/dedup reported.

Proposed, awarded and received amounts stay distinct.

Evidence: Reported whole implementation merged; acceptance remains. Reference: PR15; master line 616.

Master work or verification: P3/P5: retain requested/awarded; add receipt event/field with date and source.

Expected check: Pending request, award and partial receipt show distinct values.

Dependency or boundary: Requested/awarded exist; received amount not found.

Financial/impact entries carry evidence, dates and edit history.

Evidence: Reported whole implementation merged; acceptance remains. Reference: PR16; master line 617.

Master work or verification: P3: extend versioned fact model for bounded entries.

Expected check: Change attendance/amount; current and previous values show actor/time/evidence.

Dependency or boundary: No tracked figures with history reported.

Deduplicate repeated imported financial/impact records without losing provenance.

Evidence: Not examined in this run; current implementation unknown. Reference: PR17; master line 618.

Master work or verification: P3/P2: scoped identity/hash and reviewed likely-duplicate matching.

Expected check: Same award or attendance file imported twice counts once and retains both provenance events.

Dependency or boundary: No tracked-figure deduplication reported.

Show clear bounded financial/impact summaries.

Evidence: Not examined in this run; current implementation unknown. Reference: PR18; master line 619.

Master work or verification: P3: simple totals by compatible kind/period/status, not elaborate dashboards.

Expected check: Summary reconciles editable entries and does not equate award with cash.

Dependency or boundary: Summary atom not separately assessed; lack of tracked figures does not establish every summary is absent.

Budgets and financial planning

Build a reusable full-cost line-item budget

Traceability group F36; capability.

Scope connection: One correctable budget model built from available figures and a full-cost interview, with deterministic arithmetic, units/periods, honest unknowns and safe failure. Cost fields and finance permissions are not features.

Evidence in this group: 15 unexamined in this run.

Reuse editable line-item budget with deterministic arithmetic.

Evidence: Not examined in this run; current implementation unknown. Reference: BU01; master line 658.

Master work or verification: P5: retain line-item/unmatched-dollar checks and trace connected caller.

Expected check: Edit quantity/rate and reconcile line/total on existing application.

Dependency or boundary: Plan-to-budget caller reportedly only in unmerged PR #1081; do not treat PR as baseline.

Start from actual available figures rather than predetermined total.

Evidence: Not examined in this run; current implementation unknown. Reference: BU02; master line 659.

Master work or verification: P5: verify focused budget interview and sourced inputs.

Expected check: Budget with no rate stays unresolved; no fabricated amount fills target award.

Dependency or boundary: Existing lines do not prove interview behavior.

Full-cost interview considers delivery/preparation hours.

Evidence: Not examined in this run; current implementation unknown. Reference: BU03; master line 660.

Master work or verification: P5: verify bounded prompts for delivery/preparation hours from actual program needs.

Expected check: Fixture requiring delivery/preparation hours includes supported cost or explicit unresolved/not-applicable state.

Dependency or boundary: Technical interview design supports R03; exact UI/prompt taxonomy is not individually approved.

Full-cost interview considers staffing rates and supervision.

Evidence: Not examined in this run; current implementation unknown. Reference: BU04; master line 661.

Master work or verification: P5: verify bounded prompts for staffing rates and supervision from actual program needs.

Expected check: Fixture requiring staffing rates and supervision includes supported cost or explicit unresolved/not-applicable state.

Dependency or boundary: Technical interview design supports R03; exact UI/prompt taxonomy is not individually approved.

Full-cost interview considers accessibility and recruitment.

Evidence: Not examined in this run; current implementation unknown. Reference: BU05; master line 662.

Master work or verification: P5: verify bounded prompts for accessibility and recruitment from actual program needs.

Expected check: Fixture requiring accessibility and recruitment includes supported cost or explicit unresolved/not-applicable state.

Dependency or boundary: Technical interview design supports R03; exact UI/prompt taxonomy is not individually approved.

Full-cost interview considers equipment and evaluation.

Evidence: Not examined in this run; current implementation unknown. Reference: BU06; master line 663.

Master work or verification: P5: verify bounded prompts for equipment and evaluation from actual program needs.

Expected check: Fixture requiring equipment and evaluation includes supported cost or explicit unresolved/not-applicable state.

Dependency or boundary: Technical interview design supports R03; exact UI/prompt taxonomy is not individually approved.

Full-cost interview considers administration and shared costs.

Evidence: Not examined in this run; current implementation unknown. Reference: BU07; master line 664.

Master work or verification: P5: verify bounded prompts for administration and shared costs from actual program needs.

Expected check: Fixture requiring administration and shared costs includes supported cost or explicit unresolved/not-applicable state.

Dependency or boundary: Technical interview design supports R03; exact UI/prompt taxonomy is not individually approved.

Full-cost interview considers permitted contingency and sensible growth.

Evidence: Not examined in this run; current implementation unknown. Reference: BU08; master line 665.

Master work or verification: P5: verify bounded prompts for permitted contingency and sensible growth from actual program needs.

Expected check: Fixture requiring permitted contingency and sensible growth includes supported cost or explicit unresolved/not-applicable state.

Dependency or boundary: Technical interview design supports R03; exact UI/prompt taxonomy is not individually approved.

Prefer role aggregates and restrict identifiable individual compensation sources.

Evidence: Not examined in this run; current implementation unknown. Reference: BU09; master line 666.

Master work or verification: P5/privacy: permission and sensitivity propagation on source and aggregate.

Expected check: Unauthorized reviewer cannot inspect salary source or identifying aggregate.

Dependency or boundary: No budget-sensitive-data test supplied.

Cost line identifies quantity, rate, period, currency, source/estimate and formula.

Evidence: Not examined in this run; current implementation unknown. Reference: BU10; master line 667.

Master work or verification: P5: inspect existing line model; add missing typed fields/locators.

Expected check: Line can be recalculated from explicit units/source and estimate remains labeled.

Dependency or boundary: Line-item support does not prove all fields.

Unknown cost is not zero or fabricated rate.

Evidence: Not examined in this run; current implementation unknown. Reference: BU11; master line 668.

Master work or verification: P5: typed missing inputs and invalid/pending totals.

Expected check: Missing rate produces unresolved total, not zero or plausible model rate.

Dependency or boundary: No golden missing-input result supplied.

Exact decimal arithmetic and explicit rounding rules.

Evidence: Not examined in this run; current implementation unknown. Reference: BU12; master line 669.

Master work or verification: P5: reuse deterministic arithmetic, pin rounding and test decimals.

Expected check: Golden decimal fixture matches expected totals without float drift.

Dependency or boundary: Deterministic unmatched-dollar check is narrower than full formula proof.

Incompatible periods/currencies rejected; conversion needs dated sourced rate/policy.

Evidence: Not examined in this run; current implementation unknown. Reference: BU13; master line 670.

Master work or verification: P5: period/unit/currency validation and explicit permitted conversion.

Expected check: Monthly/hourly and mixed-currency fixtures cannot silently sum incompatible values.

Dependency or boundary: No conversion policy selected by reports.

Budget calculation failure retains inputs and prevents falsely valid totals.

Evidence: Not examined in this run; current implementation unknown. Reference: BU51; master line 708.

Master work or verification: P5: distinct pending/error calculation state; deterministic retry.

Expected check: Fault calculation; inputs survive and valid/reconciled badge absent.

Dependency or boundary: No failure-state result supplied.

Budget editing does not grant finance/domain approval.

Evidence: Not examined in this run; current implementation unknown. Reference: BU52; master line 709.

Master work or verification: P5/identity: separate operation grants and revision-bound approval.

Expected check: Editor changes line but cannot claim finance approval; sole authorized owner path works.

Dependency or boundary: Title-based signoff conflicts with capability model.

Check a budget against funder rules

Traceability group F37; capability.

Scope connection: Eligibility periods/categories, caps, indirect costs, matching and restrictions are rule variants of one evidence-grounded compliance check.

Evidence in this group: 6 unexamined in this run.

Check eligible periods/categories against actual funder instructions.

Evidence: Not examined in this run; current implementation unknown. Reference: BU14; master line 671.

Master work or verification: P5/requirements: source-backed deterministic eligible periods/categories check.

Expected check: Fixture violating eligible periods/categories returns explicit finding with rule source; confirmation cannot suppress it.

Dependency or boundary: Broad absence of restrictions does not prove each cap/match/indirect/period check is absent; verify this atom first.

Check request caps against actual funder instructions.

Evidence: Not examined in this run; current implementation unknown. Reference: BU15; master line 672.

Master work or verification: P5/requirements: source-backed deterministic request caps check.

Expected check: Fixture violating request caps returns explicit finding with rule source; confirmation cannot suppress it.

Dependency or boundary: Broad absence of restrictions does not prove each cap/match/indirect/period check is absent; verify this atom first.

Check indirect rate and base against actual funder instructions.

Evidence: Not examined in this run; current implementation unknown. Reference: BU16; master line 673.

Master work or verification: P5/requirements: source-backed deterministic indirect rate and base check.

Expected check: Fixture violating indirect rate and base returns explicit finding with rule source; confirmation cannot suppress it.

Dependency or boundary: Broad absence of restrictions does not prove each cap/match/indirect/period check is absent; verify this atom first.

Check matching requirements against actual funder instructions.

Evidence: Not examined in this run; current implementation unknown. Reference: BU17; master line 674.

Master work or verification: P5/requirements: source-backed deterministic matching requirements check.

Expected check: Fixture violating matching requirements returns explicit finding with rule source; confirmation cannot suppress it.

Dependency or boundary: Broad absence of restrictions does not prove each cap/match/indirect/period check is absent; verify this atom first.

Check restricted expenses against actual funder instructions.

Evidence: Not examined in this run; current implementation unknown. Reference: BU18; master line 675.

Master work or verification: P5/requirements: source-backed deterministic restricted expenses check.

Expected check: Fixture violating restricted expenses returns explicit finding with rule source; confirmation cannot suppress it.

Dependency or boundary: Broad absence of restrictions does not prove each cap/match/indirect/period check is absent; verify this atom first.

Ambiguous cost rule keeps source passage and proposed human-confirmed interpretation.

Evidence: Not examined in this run; current implementation unknown. Reference: BU19; master line 676.

Master work or verification: P5: unresolved/conditional eligibility and interpretation review.

Expected check: Ambiguous indirect rule displays competing interpretation; no false eligible total.

Dependency or boundary: No atom-level rule-resolution evidence.

Review and adopt budget changes

Traceability group F38; capability.

Scope connection: Figure confirmation, imported-row comparison, impact previews and narrative reconciliation are one controlled budget-adoption workflow.

Evidence in this group: 8 unexamined in this run.

Figure confirmation shows scope/source/checks/dependencies and records actor/value/context/time.

Evidence: Not examined in this run; current implementation unknown. Reference: BU20; master line 677.

Master work or verification: P5: verify value-card confirmation audit distinct from plan acceptance.

Expected check: Confirm specific value; history records exact value/context and discrepancy remains visible.

Dependency or boundary: Plan-part accept does not establish figure confirmation schema.

Declining figure confirmation permits discussion or local edit.

Evidence: Not examined in this run; current implementation unknown. Reference: BU21; master line 678.

Master work or verification: P5: no branch opens correction without silently accepting number.

Expected check: Select No and correct rate; original source retained, downstream changes proposed.

Dependency or boundary: No supplied behavior evidence.

Dependent totals/narrative/commitments change only through accepted impact preview.

Evidence: Not examined in this run; current implementation unknown. Reference: BU22; master line 679.

Master work or verification: P5/P3: old/new change set with affected approvals; explicit selection.

Expected check: Change rate; preview shows all dependencies; rejecting leaves adopted prose intact.

Dependency or boundary: Staleness detection is not dependent-change adoption.

Quoted and calculated totals can coexist while discrepancy reviewed.

Evidence: Not examined in this run; current implementation unknown. Reference: BU23; master line 680.

Master work or verification: P5: separate source total and computed total, no silent source correction.

Expected check: Incorrect quoted total stays attributed; computed mismatch shown alongside.

Dependency or boundary: No relevant report evidence.

Budget upload purpose confirmed before replacement/adoption.

Evidence: Not examined in this run; current implementation unknown. Reference: BU24; master line 681.

Master work or verification: P2/P5: reuse replacement/new period/additional prompt with impact preview.

Expected check: Upload newer budget and decline replacement; adopted budget unchanged.

Dependency or boundary: Newest file is not automatic authority.

Budget-row comparison respects program, period, item, units and basis; ambiguous/unmatched rows visible.

Evidence: Not examined in this run; current implementation unknown. Reference: BU25; master line 682.

Master work or verification: P5/P2: scoped mapping and unmatched-row review.

Expected check: Same-name cost in other period is not merged; ambiguous row waits for selection.

Dependency or boundary: General file parsing/duplicate detection cannot establish semantic matching.

Batch budget acceptance previews selected changes and consequences; prior sources/decisions retained.

Evidence: Not examined in this run; current implementation unknown. Reference: BU26; master line 683.

Master work or verification: P5: bounded selection-based batch adoption, revision guard.

Expected check: Select two of three changes; only two adopt with exact history and impacts.

Dependency or boundary: No atom-level acceptance evidence.

Budget/narrative reconciliation-pending stays visible until resolved.

Evidence: Not examined in this run; current implementation unknown. Reference: BU27; master line 684.

Master work or verification: P5/review: explicit pending reconciliation signal and affected-location list.

Expected check: Narrative still uses old total; UI cannot show reconciled/Ready contrary to required rules.

Dependency or boundary: Ready survives edits per A208; substantive materiality policy needs evidence.

Allocate program costs across funding sources

Traceability group F39; capability.

Scope connection: One shared program-cost/funding-allocation model distinguishes asks, awards, receipts, internal contributions and alternative/overlapping commitments to avoid double counting.

Evidence in this group: 11 unexamined in this run.

One program-cost model supports one or multiple linked grants with human confirmation.

Evidence: Not examined in this run; current implementation unknown. Reference: BU28; master line 685.

Master work or verification: P5/P3: confirmed program/grant links and allocation records.

Expected check: Two grants reference one cost model without duplicate program costs.

Dependency or boundary: Allocation across grants absent.

Ask relationships explicitly additive, alternative, replacement/offset or undecided.

Evidence: Not examined in this run; current implementation unknown. Reference: BU29; master line 686.

Master work or verification: P5: typed relationship with user-confirmed targets.

Expected check: Alternative grants never sum as both available; undecided stays visible.

Dependency or boundary: No allocations reported; human classification not inferred from names.

Allocations identify covered line, quantity/amount, period and restrictions.

Evidence: Not examined in this run; current implementation unknown. Reference: BU30; master line 687.

Master work or verification: P5: bounded cost-line allocation model.

Expected check: Allocated coverage conserves amount and cannot exceed eligible line/period.

Dependency or boundary: No cross-grant allocation support.

Existing program cost, incremental expansion and replacement funding remain distinct.

Evidence: Not examined in this run; current implementation unknown. Reference: BU31; master line 688.

Master work or verification: P5: tag basis on costs/asks and preserve in summaries.

Expected check: Expansion request does not count existing cost twice or misstate replacement as new activity.

Dependency or boundary: No report atom for cost basis.

Requested/conditional/awarded/declined funding states not confused with cash receipts.

Evidence: Not examined in this run; current implementation unknown. Reference: BU32; master line 689.

Master work or verification: P5: retain existing requested/awarded stages; verify conditional state and source.

Expected check: Award decision and payment chronology remain separately inspectable.

Dependency or boundary: Received amount absent; conditional atom unverified.

Receipt, encumbrance and spend events keep dated amounts distinct.

Evidence: Not examined in this run; current implementation unknown. Reference: BU33; master line 690.

Master work or verification: P5: implement only bounded planning/event representation needed for cash, not ledger.

Expected check: Award partly received/committed/spent exposes distinct totals and dates.

Dependency or boundary: Received absent; encumbrance/spend atoms not separately searched. Advanced accounting deferred.

Pending asks are never counted as available resources.

Evidence: Not examined in this run; current implementation unknown. Reference: BU34; master line 691.

Master work or verification: P5: verify cash calculations use permitted received/available inputs, not merely awarded.

Expected check: Pending request excluded from cash; awarded unpaid also distinguished.

Dependency or boundary: Secured award count exists but awarded is not cash.

Alternative groups and coverage limits prevent double counting; overlap requires reconciliation.

Evidence: Not examined in this run; current implementation unknown. Reference: BU35; master line 692.

Master work or verification: P5: constraint check over allocations and alternative groups.

Expected check: Accept overlapping awards; excess coverage flagged before adopted allocation.

Dependency or boundary: No cross-grant allocations reported.

Available internal money needs dated unrestricted, uncommitted balance; annual budget not spare cash.

Evidence: Not examined in this run; current implementation unknown. Reference: BU36; master line 693.

Master work or verification: P5: explicit available-balance input with date/restriction.

Expected check: Organization annual revenue never auto-populates available contribution.

Dependency or boundary: No cash/scenario implementation reported.

Internal contribution requires explicit authority and is not automatically formal match.

Evidence: Not examined in this run; current implementation unknown. Reference: BU37; master line 694.

Master work or verification: P5/approval: separate contribution proposal and permitted finance approval.

Expected check: Shortfall produces proposal, not automatic obligation or qualified match.

Dependency or boundary: General approval toggles do not establish contribution authority.

Cross-application shared costs/commitments are checked before adoption.

Evidence: Not examined in this run; current implementation unknown. Reference: PR24; master line 625.

Master work or verification: P3/P5: bounded shared-cost dependency check, not global accounting.

Expected check: Two pending applications overlapping cost warn without treating pending funds as secured.

Dependency or boundary: No allocations or post-edit cross-answer check reported; cross-app check not explicitly searched.

Project restricted and unrestricted cash flow

Traceability group F40; capability.

Scope connection: Period cash calculations distinguish restrictions, reimbursement/holdback timing and within-period gaps without assuming bridging finance.

Evidence in this group: 5 unexamined in this run.

Compute period cash from opening balance, permitted receipts/contributions and disbursements.

Evidence: Not examined in this run; current implementation unknown. Reference: BU38; master line 695.

Master work or verification: P5: deterministic cash view separate from award total.

Expected check: Golden timing fixture identifies negative cash period despite funded total.

Dependency or boundary: Cash timing absent.

Track restricted cash separately from unrestricted funds.

Evidence: Not examined in this run; current implementation unknown. Reference: BU39; master line 696.

Master work or verification: P5: restriction-aware receipt/allocation constraints.

Expected check: Restricted payment cannot cover unrelated unfunded cost.

Dependency or boundary: Restrictions/cash absent.

Represent reimbursement, holdbacks, payment conditions and uncertain dates.

Evidence: Not examined in this run; current implementation unknown. Reference: BU40; master line 697.

Master work or verification: P5: sourced payment-timing assumptions with unknown states.

Expected check: Reimbursement-lag fixture shows cash need; unknown payment date not invented.

Dependency or boundary: Cash timing absent.

Monthly positive total is not proof of within-month solvency.

Evidence: Not examined in this run; current implementation unknown. Reference: BU41; master line 698.

Master work or verification: P5: use dated events when known or disclose coarse-period limitation.

Expected check: Receipt after payroll yields temporary cash gap or explicit insufficient date detail.

Dependency or boundary: Not separately assessed; do not infer full transaction ledger requirement.

Never presume bridging finance or obligation to fund a shortfall.

Evidence: Not examined in this run; current implementation unknown. Reference: BU42; master line 699.

Master work or verification: P5: preserve unfunded outcome and optional authorized actions.

Expected check: Reduced award leaves explicit shortfall without invented loan/internal contribution.

Dependency or boundary: No scenario acceptance test supplied.

Compare and adopt feasible funding scenarios

Traceability group F41; capability.

Scope connection: Explore full/reduced/minimum options and adopt a chosen scenario after impacts are reviewed. Slider, phasing options, infeasibility checks and stakeholder draft updates are parts of one decision workflow.

Evidence in this group: 8 unexamined in this run.

Funding slider/amount changes exploratory assumption, not adopted budget.

Evidence: Not examined in this run; current implementation unknown. Reference: BU43; master line 700.

Master work or verification: P5: scenario branch separate from adopted plan.

Expected check: Move percentage; adopted budget/text/approval remain unchanged.

Dependency or boundary: No reduced-award/phased scenario records reported; slider is recommended UI shape.

Compare full, reduced and minimum-viable scenarios retaining fixed/indivisible/minimum costs and dependencies.

Evidence: Not examined in this run; current implementation unknown. Reference: BU44; master line 701.

Master work or verification: P5: deterministic feasibility constraints on scenario copies.

Expected check: 50% funding does not halve fixed venue cost or violate minimum staffing silently.

Dependency or boundary: Scenarios absent.

Expose both funding and cash gaps; models cannot label infeasible scenario feasible.

Evidence: Not examined in this run; current implementation unknown. Reference: BU45; master line 702.

Master work or verification: P5: feasibility flag from deterministic outputs, model explanation separate.

Expected check: Funded total with delayed receipt remains cash-infeasible; model cannot override.

Dependency or boundary: No scenario/cash code reported.

Do not scale participants or outcomes directly with funding percentage.

Evidence: Not examined in this run; current implementation unknown. Reference: BU46; master line 703.

Master work or verification: P5: independent capacity/delivery assumptions and constraints.

Expected check: Funding cut yields reviewed delivery options, not automatic equal-percentage outcome claim.

Dependency or boundary: Absence of scenarios is known; exact no-scaling rule remains unverified.

Offer reduce/phase/delay, seek funding, decline or authorized contribution options; user decides.

Evidence: Not examined in this run; current implementation unknown. Reference: BU47; master line 704.

Master work or verification: P5: bounded options over scenarios and explicit go/no-go choice.

Expected check: User compares phased/delayed variants and may reject all without changing adopted work.

Dependency or boundary: Q40 normally after submission/on request unless funder asks contingency; do not force early scenario exercise.

Scenario states exploratory/reviewed/adopted/rejected remain distinct.

Evidence: Not examined in this run; current implementation unknown. Reference: BU48; master line 705.

Master work or verification: P5: small explicit state model, not generic workflow engine.

Expected check: Review alone does not adopt; rejected scenario stays separate and attributable.

Dependency or boundary: No scenario records reported.

Scenario adoption previews budget, commitments, dates, narrative and approval impacts.

Evidence: Not examined in this run; current implementation unknown. Reference: BU49; master line 706.

Master work or verification: P5/review: apply chosen revision-aware change set and reopen affected approvals.

Expected check: Adopt one scenario; exact chosen dependencies update, old version/history retained.

Dependency or boundary: Ready/signature excludes budget per A208, a connected approval dependency.

Scenario stakeholder updates are drafts for human review, never automatic outreach.

Evidence: Not examined in this run; current implementation unknown. Reference: BU50; master line 707.

Master work or verification: P5/drafting: prepare requested update without send side effects.

Expected check: Adopt scenario and verify no message transmitted; requested draft identifies proposed change.

Dependency or boundary: No report evidence for this specific communication path.

Application lifecycle approval submission and outcomes

Prepare an application from an opportunity

Traceability group F07; capability.

Scope connection: Pursue creates or recovers preparation with immutable handoff, not paid drafting. Optional application ownership is one durable responsibility assignment, not organization primary ownership.

Evidence in this group: 7 unexamined in this run; 1 partial merged; 2 whole merged; 2 pre-existing locally verified; 3 under int-b6 gate.

Pursue binds selected opportunity cycle/track and relevant program; unresolved cycle is not invented. G S07; F §12C; D §13B.

Evidence: Not examined in this run; current implementation unknown. Reference: FD054; master line 907.

Master work or verification: Introduce selected scope and pursuit slot over existing app identity.

Expected check: Correct cycle/track and program stored; unknown requires explicit handling (AT14).

Handoff includes immutable opportunity revision plus source hashes, requirements, amounts, restrictions, milestones and uncertainty. F §12C; D §13B.

Evidence: Not examined in this run; current implementation unknown. Reference: FD055; master line 908.

Master work or verification: Add factual handoff manifest, not another application owner.

Expected check: Re-read original revision after source changes; references remain inspectable (AT23).

Handoff creation checks current original source or records explicit unavailable/stale override reason. F §11/§12C; G S07.

Evidence: Not examined in this run; current implementation unknown. Reference: FD056; master line 909.

Master work or verification: Connect verification and permitted reasoned override without claiming current.

Expected check: Source unavailable still permits authorized warned preparation; status stays unavailable.

Handoff and application creation recover separately with durable receipts/idempotent retry. G S07; F §12A; D §13A.

Evidence: Not examined in this run; current implementation unknown. Reference: FD057; master line 910.

Master work or verification: Retain lock; add operation receipt across handoff/create boundary.

Expected check: Crash after handoff resumes same operation and one application (AT13).

Source updates become application-impact proposals, not silent draft/requirement adoption. F §12C; D §13B; G S09.

Evidence: Not examined in this run; current implementation unknown. Reference: FD058; master line 911.

Master work or verification: Emit before/after field impact tied to adopted version.

Expected check: Changed requirement flags application; existing prose remains unchanged (AT23).

Downstream application stage/outcome events are minimal, permissioned and idempotent. F §12C; D §13B.

Evidence: Not examined in this run; current implementation unknown. Reference: FD059; master line 912.

Master work or verification: Add scoped external_application_id/status_event_id receipts, no private prose.

Expected check: Duplicate status event changes metrics once; unauthorized tenant rejected.

Selected handoff does not imply drafting, external submission or an award. F R13/§12C; D §13A.

Evidence: Only part merged; finish the residual and accept. Reference: FD060; master line 913.

Master work or verification: Preserve separate factual handoff, paid Start, reported submission and outcome states.

Expected check: Handoff count is not draft/submission/award count.

Pursue stops at preparation; explicit Start draft may follow immediately without sorting all opportunities first. G V6/S07; D §13A.

Evidence: Reported whole implementation merged; acceptance remains. Reference: LC002; master line 1064.

Master work or verification: Split pursuit/preparation and explicit paid start in existing journey.

Expected check: Pursue starts no paid drafting and consumes no drafting allowance; separately authorized company-funded source verification may run. Chosen Start works without completing queue triage.

Duplicate clicks/concurrent Pursue reuse default preparation rather than accidentally creating duplicate attempts. G S07; R AT13.

Evidence: Pre-existing behavior verified locally; acceptance remains. Reference: LC003; master line 1065.

Master work or verification: Preserve tested dedup while replacing overly broad unique constraint.

Expected check: Concurrent/default replay still one pursuit slot after cycle/attempt support.

Home, application list and opportunity open the same authoritative application identity. G S08; A M01.

Evidence: Pre-existing behavior verified locally; acceptance remains. Reference: LC006; master line 1068.

Master work or verification: Keep One API authoritative; no parallel app store.

Expected check: Cross-entry navigation shows same ID, adopted versions and status.

Application owner is optional; single-user organization auto-assignment is distinct from organization primary ownership. G S07; A D.3.

Evidence: Built on an unmerged branch; int-b6 gate remains. Reference: LC008; master line 1070.

Master work or verification: Add app owner separately from organization owner with no hidden new authority.

Expected check: Multiuser unassigned app valid; sole user assigned without owner-transfer implications.

Internal due dates are editable and separate from sourced funder milestones. G S07/S09; F §4B.

Evidence: Built on an unmerged branch; int-b6 gate remains. Reference: LC009; master line 1071.

Master work or verification: Verify separate fields; add only if missing.

Expected check: Internal edit never rewrites funder deadline or source history.

Application creation/start failures remain visible and retry-safe; pending starts need recovery across replica loss. G S07/§7.2.

Evidence: Built on an unmerged branch; int-b6 gate remains. Reference: LC031; master line 1093.

Master work or verification: Preserve failure visibility; implement durable re-adoption/fencing as needed.

Expected check: Replica failure yields one recoverable operation, not duplicate/invisible paid run.

Opening a page or saving an opportunity does not start paid drafting/discovery work. G V6/S04; A D.2 records settled scope.

Evidence: Reported whole implementation merged; acceptance remains. Reference: FD032; master line 879.

Master work or verification: Retain free Save; remove view-driven run start.

Expected check: Page open/read/save cause zero model/search calls; explicit run remains possible.

Application owner assignment is optional and auto-assigned only for a single-user organization.

Evidence: Not examined in this run; current implementation unknown. Reference: IAM-013; master line 1914.

Master work or verification: Add optional assignment, preserve creator attribution independently.

Expected check: Empty owner valid; single-user default; revoked assignee handled without rewriting history.

Start another attempt or funding cycle

Traceability group F08; capability.

Scope connection: Deliberately distinct attempts/cycles preserve prior work and revalidate current requirements. Reuse previous work while retaining the old cycle and revalidating current requirements and facts.

Evidence in this group: 3 under int-b6 gate; 1 unexamined in this run; 1 whole merged.

Legitimate second attempt is allowed with separate identity. G S07; R AT14.

Evidence: Built on an unmerged branch; int-b6 gate remains. Reference: LC004; master line 1066.

Master work or verification: Separate default pursuit slot from explicit attempt records.

Expected check: Deliberate second attempt distinct; routine retry same ID.

New annual cycle is a new scoped application, not a revision that overwrites old work. G V23; R AT14.

Evidence: Built on an unmerged branch; int-b6 gate remains. Reference: LC005; master line 1067.

Master work or verification: Preserve app identity; add cycle-scoped attempts and prior context link.

Expected check: New cycle has current requirements and old app remains unchanged.

Prior application may be read as context for a new cycle but current requirements/facts are revalidated. G V23.

Evidence: Built on an unmerged branch; int-b6 gate remains. Reference: LC022; master line 1084.

Master work or verification: Wire explicit prior-context selection and revalidation, preserve old read-only record.

Expected check: Old amount/date not silently accepted as current; prior text retained.

Next-cycle reuse preserves prior application and revalidates current requirements/facts. PG V23, S08/S09, PT05

Evidence: Not examined in this run; current implementation unknown. Reference: LC10; master line 1777.

Master work or verification: Reuse context through explicit new scope while retaining original record and stale-fact checks.

Expected check: Changed cycle/questions/budget produce new adopted set; old record and package hashes unchanged.

Dependency or boundary: REQ/FACT/DOC

Prior-cycle reuse preserves old record and revalidates new questions/facts. PG V23/S08

Evidence: Reported whole implementation merged; acceptance remains. Reference: DR35; master line 1397.

Master work or verification: Connect context reuse without accepting old facts silently

Expected check: changed-cycle T01/PT05

Dependency or boundary: REQ/FACT/DOC

Track applications and next actions

Traceability group F09; capability.

Scope connection: Application list and meaningful counts represent one portfolio/work-queue capability. Home is one actionable work overview; active, due-next and attention sections are variants rather than separate features.

Evidence in this group: 1 pre-existing locally verified; 8 unexamined in this run.

Application list shows actual state/cycle, owner, funder/internal dates and next useful action, not invented completion percent. G S08.

Evidence: Pre-existing behavior verified locally; acceptance remains. Reference: LC007; master line 1069.

Master work or verification: Extend actual list/projection only for missing required metadata.

Expected check: Partial metadata does not erase app; authorized counts agree.

Track open, finished and submitted application counts, plus time to a reviewable draft.

Evidence: Not examined in this run; current implementation unknown. Reference: WA35; master line 339.

Master work or verification: Define open/finished and reviewable milestone without inventing new lifecycle states; instrument counts/timing separately from human waits and machine latency.

Expected check: Fixed fixture reconciles counts to existing application records and times the actual reviewable output, not first token or background-job completion.

Home lists active/open applications.

Evidence: Not examined in this run; current implementation unknown. Reference: UX006; master line 2263.

Master work or verification: Reconfirm current candidate, correct permissions and all lifecycle states, not only screenshot data.

Home shows what is due next.

Evidence: Not examined in this run; current implementation unknown. Reference: UX007; master line 2264.

Master work or verification: Exercise source/internal deadlines and absence/unknown cases on current candidate.

Home includes actionable needs-attention items.

Evidence: Not examined in this run; current implementation unknown. Reference: UX008; master line 2265.

Master work or verification: Connect durable paused-run/save-failure/material-clarification signals; final item types/order remain design detail.

If neither active applications nor due-next items exists, offer find opportunities.

Evidence: Not examined in this run; current implementation unknown. Reference: UX009; master line 2266.

Master work or verification: Truth-table test all application/due combinations; existing empty-state screenshot does not establish conjunction.

Discovery empty prompt must not hide genuine attention items.

Evidence: Not examined in this run; current implementation unknown. Reference: UX010; master line 2267.

Master work or verification: Fixture with zero app/due and one attention item shows both.

Avoid duplicate issue noise on Home.

Evidence: Not examined in this run; current implementation unknown. Reference: UX011; master line 2268.

Master work or verification: One semantic issue arriving through multiple feeds appears once with provenance.

Home failed/partial reads must not appear as empty results or fresh data.

Evidence: Not examined in this run; current implementation unknown. Reference: UX012; master line 2269.

Master work or verification: Inject initial and mid-session failures; explicit out-of-date/partial status with last-good data.

Archive and resume application work

Traceability group F10; capability.

Scope connection: Archive, read/download, save-then-stop and Resume are coherent states of one lifecycle capability. Archive/read/download/explicit Resume are lifecycle variants of one capability; merge with lifecycle archive.

Evidence in this group: 13 whole merged; 3 partial merged; 1 under int-b6 gate; 8 unexamined in this run.

No-longer-pursuing offers Archive versus confirmed Delete application, not organization deletion. G V22/S08.

Evidence: Reported whole implementation merged; acceptance remains. Reference: LC010; master line 1072.

Master work or verification: Add two explicitly scoped actions using existing lifecycle owner.

Expected check: Action names target selected app; organization/other apps unaffected.

Archive retains completed work, documents/history and task inputs/context. G V22/V24/S08.

Evidence: Reported whole implementation merged; acceptance remains. Reference: LC011; master line 1073.

Master work or verification: Atomically capture/persist archive checkpoint before completion signal.

Expected check: Archived content/history reload; failed save cannot report successful archive.

Archive persists resumable operational execution state, not private model reasoning. G V24.

Evidence: Reported whole implementation merged; acceptance remains. Reference: LC012; master line 1074.

Master work or verification: Reuse checkpoint state + task inputs and explicit archived state.

Expected check: Resume reconstructs authorized work without hidden reasoning transcript.

Archive terminates active run after durable save. G V24.

Evidence: Reported whole implementation merged; acceptance remains. Reference: LC013; master line 1075.

Master work or verification: Connect application archive to existing cancel/checkpoint protocol.

Expected check: Active run becomes archived/resumable and dispatch stops after archive.

Archive cancels queued starts and prevents delayed new dispatch. G V24.

Evidence: Reported whole implementation merged; acceptance remains. Reference: LC014; master line 1076.

Master work or verification: Narrow existing cancellation/fence to app with epoch/revision checks.

Expected check: Queued retry arriving after archive cannot start Loom.

Already-issued noncancellable provider call may settle safely within caps without starting more archived work. G V24.

Evidence: Reported whole implementation merged; acceptance remains. Reference: LC015; master line 1077.

Master work or verification: Fence follow-on effects, reconcile result and original-period usage.

Expected check: Late response charged at most once; no new archived call/output silently adopted.

Archive suspend-state is truthful: failed persistence or partial cancellation cannot look fully archived. G S08.

Evidence: Reported whole implementation merged; acceptance remains. Reference: LC016; master line 1078.

Master work or verification: Durable archive operation receipt with retry/reconciliation states.

Expected check: Crash between save/cancel surfaces truthful state and resumes safe cleanup.

Archived application remains accessible but inactive for authorized read. G V28 controls after A target.

Evidence: Reported whole implementation merged; acceptance remains. Reference: LC017; master line 1079.

Master work or verification: Add read-only projection; permission checks remain current.

Expected check: Open/read does not change stage or resume paid run.

Archived materials remain downloadable by authorized users. G V28.

Evidence: Reported whole implementation merged; acceptance remains. Reference: LC018; master line 1080.

Master work or verification: Reuse permitted retained-file/export route in read-only state.

Expected check: Download succeeds without activation and respects current file rights.

Editing an archived app requires explicit action labeled Resume. G V28.

Evidence: Reported whole implementation merged; acceptance remains. Reference: LC019; master line 1081.

Master work or verification: Enforce at API plus UI, not just hide editor.

Expected check: Stale editor write refused; Resume chosen before mutation.

Resume rechecks current rights and allowance rather than auto-restarting after allowance/service recovery. G V24/V28; G §2.3.

Evidence: Only part merged; finish the residual and accept. Reference: LC020; master line 1082.

Master work or verification: Route explicit resume through normal guards and archive epoch.

Expected check: Revoked/exhausted caller cannot resume; renewed balance alone does nothing.

Late resume displays passed deadline and offers continue same app or prepare next cycle. G V26.

Evidence: Built on an unmerged branch; int-b6 gate remains. Reference: LC021; master line 1083.

Master work or verification: Add factual deadline check and explicit branch, not inferred closure.

Expected check: User selects either path; no silently extended deadline or changed cycle.

Archive reminder suspension is required, not an unresolved product choice. G V26 supersedes A D8.

Evidence: Reported whole implementation merged; acceptance remains. Reference: LC028; master line 1090.

Master work or verification: Correct tracker decision status; implement with notification owner.

Expected check: Archived deadline event generates no app deadline reminder until resumed.

No longer pursuing offers Archive retaining documents/history or confirmed Delete application. PG S08, V22, PT05

Evidence: Only part merged; finish the residual and accept. Reference: LC01; master line 1768.

Master work or verification: Connect two clearly distinct actions to existing application state; do not use organization deletion.

Expected check: Choose each branch; cancellation leaves original state and records intact.

Dependency or boundary: DOC/ID/RUN

Archive persists completed output before declaring success. PG S08, V24, PT05

Evidence: Not examined in this run; current implementation unknown. Reference: LC02; master line 1769.

Master work or verification: Verify output receipt before archive commit; expose failure truthfully.

Expected check: Inject output-save failure: no successful archive label; acknowledged work remains recoverable.

Dependency or boundary: DOC/RUN

Archive persists inputs/context and resumable operational state. PG V24, PT05

Evidence: Not examined in this run; current implementation unknown. Reference: LC03; master line 1770.

Master work or verification: Persist task inputs, scope and operational checkpoint; private reasoning is not required.

Expected check: Restart process after archive and reconstruct operational continuation without private reasoning.

Dependency or boundary: RUN/DOC

Archive terminates active work and cancels queued starts. PG V24, PT05

Evidence: Not examined in this run; current implementation unknown. Reference: LC04; master line 1771.

Master work or verification: Connect existing cancellation mechanisms at application scope and fence late writes.

Expected check: Archive with one running and one queued job: neither dispatches new work; unrelated app continues.

Dependency or boundary: RUN/BIND

Noncancellable in-flight calls settle within existing caps with no new archived dispatch. PG V24, PT11

Evidence: Not examined in this run; current implementation unknown. Reference: LC05; master line 1772.

Master work or verification: Reconcile existing call/hold outcome once; retain useful result safely without restarting work.

Expected check: Archive during uncertain provider response: no duplicate charge/dispatch; settlement and result attributable.

Dependency or boundary: RUN/DOC

Archived applications allow authorized read/download but remain inactive. PG V28, S08, PT05

Evidence: Reported whole implementation merged; acceptance remains. Reference: LC06; master line 1773.

Master work or verification: Expose retained artifacts under current rights without run restart.

Expected check: Open and download archived material; state stays archived and run ledger unchanged.

Dependency or boundary: ID/DOC/OUT

Changes to an archived application require explicit action labeled Resume. PG V28, PT05

Evidence: Reported whole implementation merged; acceptance remains. Reference: LC07; master line 1774.

Master work or verification: Fence writes from stale tabs and require Resume before modifications.

Expected check: Stale edit/API call denied while archived; UI shows exact Resume action.

Dependency or boundary: ID/DOC/RUN

Explicit resume revalidates current permission and allowance. PG V24/V28, PT05/PT11

Evidence: Only part merged; finish the residual and accept. Reference: LC08; master line 1775.

Master work or verification: Wire explicit resume through existing current-rights/allowance checks.

Expected check: Revoked or exhausted user cannot restart paid work; authorized permitted resume can.

Dependency or boundary: ID/RUN

Passed deadline on resume is shown with continue versus prepare next cycle choice. PG V26, PT05

Evidence: Not examined in this run; current implementation unknown. Reference: LC09; master line 1776.

Master work or verification: Show actual passed deadline and preserve decision without inventing extension or switching cycle.

Expected check: Past-deadline resume presents both choices; no cycle or deadline changes before selection.

Dependency or boundary: REQ/DOC/RUN

Archive durably saves completed work and operational state before terminating active/queued work.

Evidence: Not examined in this run; current implementation unknown. Reference: RUN-009; master line 1989.

Master work or verification: Reuse narrowed start canceller and Loom cancellation; transaction/order/fences matter.

Expected check: Crash at archive steps preserves work and leaves no runnable orphan.

Archived records remain read/download accessible but editing requires explicit Resume.

Evidence: Not examined in this run; current implementation unknown. Reference: RUN-010; master line 1990.

Master work or verification: Enforce inactive state server-side; ordinary read does not restart.

Expected check: Read/download allowed under rights; write denied until Resume, no incidental dispatch.

Already-issued archive call outcomes reconcile safely without blindly replaying or restarting archived work.

Evidence: Not examined in this run; current implementation unknown. Reference: RUN-011; master line 1991.

Master work or verification: Use provider receipt and cancellation fence; preserve charge/output separately.

Expected check: Late response and unknown-charge cases settle without app reactivation.

Delete a selected application

Traceability group F11; capability.

Scope connection: Scoped deletion, authority, confirmation and shared-record preservation are variants of deletion. Deletion grant and recovery-policy conditions belong to the existing selected-application deletion capability. Merge with lifecycle deletion; no fixed recovery period is assumed.

Evidence in this group: 5 residual examined missing or blocked; 7 unexamined in this run.

Application Delete requires admin or specific admin-delegated delete authority. G V25.

Evidence: Examined gap or blocker remains in the supplied evidence. Reference: LC023; master line 1085.

Examined ledger finding: D-07. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: Add explicit delete permission distinct from draft/edit.

Expected check: Ordinary editor denied; scoped grant succeeds with actor audit.

Application Delete requires confirmation identifying selected app and actual consequences. G V22/V25/V26.

Evidence: Examined gap or blocker remains in the supplied evidence. Reference: LC024; master line 1086.

Examined ledger finding: D-07. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: Implement clear confirmation and receipt without inventing approved recovery period.

Expected check: Cancel has no effect; wrong/stale target cannot delete another app.

Delete removes only selected application's owned records and links. G V26.

Evidence: Examined gap or blocker remains in the supplied evidence. Reference: LC025; master line 1087.

Examined ledger finding: D-07. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: Inventory app-owned rows and dependencies before deletion command.

Expected check: Selected app gone per allowed lifecycle; unrelated app IDs remain intact.

Delete preserves shared organization documents and records referenced by other applications. G V26 supersedes A X02 'proposed safeguard'.

Evidence: Examined gap or blocker remains in the supplied evidence. Reference: LC026; master line 1088.

Examined ledger finding: D-07. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: Reference-aware delete and shared-record protection.

Expected check: Shared source used by app B remains readable and usable after A deletion.

App deletion recoverability, purge timing and retention are not inferred from organization 30-day hold. G V26/Remaining closure.

Evidence: Examined gap or blocker remains in the supplied evidence. Reference: LC027; master line 1089.

Examined ledger finding: D-07. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: Obtain scoped policy only for unresolved deletion mechanics; no new product behavior invented.

Expected check: Signed-off policy and route test; no assumption that app delete equals org purge.

Only admin or explicitly admin-authorized user may delete application. PG V25, PT05

Evidence: Not examined in this run; current implementation unknown. Reference: LC11; master line 1778.

Master work or verification: Use admin or explicit delegated deletion capability; edit permission is insufficient.

Expected check: Admin and delegated user allowed; edit-only and revoked delegate denied at action time.

Dependency or boundary: ID/POLICY

Application deletion requires confirmation identifying selected application and consequences. PG V22/V25/V26, S08

Evidence: Not examined in this run; current implementation unknown. Reference: LC12; master line 1779.

Master work or verification: Provide explicit confirmation and cancel path; do not impose unapproved typed-confirmation policy.

Expected check: Cancel changes nothing; confirm names correct app and only authorized consequences.

Dependency or boundary: ID/DOC

Delete only selected application records/links; preserve shared organization and other-used records. PG V26, PT05

Evidence: Not examined in this run; current implementation unknown. Reference: LC13; master line 1780.

Master work or verification: Resolve ownership/references before mutation; preserve shared documents and other applications.

Expected check: Two apps share a source: deleting one leaves other app, source and independently retained records usable.

Dependency or boundary: DOC/FACT/OUT/ID

Retention/recoverability do not inherit invented fixed purge or restore periods. PG S08/V26; L report

Evidence: Not examined in this run; current implementation unknown. Reference: LC14; master line 1781.

Master work or verification: Record policy dependency separately; do not assert immediate purge, 30-day recovery or 90-day deletion.

Expected check: Selected policy reviewed before consequential deletion; UI promises match approved actual retention.

Dependency or boundary: POLICY/DOC

Application deletion requires admin or explicit admin-issued deletion grant plus confirmation.

Evidence: Not examined in this run; current implementation unknown. Reference: IAM-019; master line 1920.

Master work or verification: Add scoped permission, not edit-power alias. Retention/recoverability remain separate.

Expected check: Editor denied, authorized delete confirmed, stale permission denied before commit.

Application deletion removes only selected application's records/links and preserves shared organization documents/other-app records.

Evidence: Not examined in this run; current implementation unknown. Reference: RET-012; master line 2009.

Master work or verification: Reference/ownership checks and run cancellation; no inferred shared-blob deletion.

Expected check: Shared-document multi-app fixture survives one app delete; app-only scope removed correctly.

Application-delete recovery/purge duration is an open policy, not an inherited 30-day organization hold.

Evidence: Not examined in this run; current implementation unknown. Reference: RET-013; master line 2010.

Master work or verification: Explicit recoverability/retention choice before promising undo/purge.

Expected check: Recorded policy and matching UI/worker/backup behavior; no unsupported promise.

Record the actual submitted package

Traceability group F13; capability.

Scope connection: Exact versions/files, optional receipt, incomplete capture and historical correction belong to one truthful submission record. One truthful submission-history capability including selected older/external files, immutable attachment bytes, optional receipts, incomplete capture and authorized corrections. No automated external submission. Recording authority is distinct from edit/approval rights, but is a permission variant of the lifecycle recording capability, not an additional feature. Merge with lifecycle recording.

Evidence in this group: 22 unexamined in this run; 1 residual examined missing or blocked; 1 other unmerged build; 13 whole merged.

Human submits externally; Beedy has no automatic submit action. G V6/V14; D §11A.

Evidence: Not examined in this run; current implementation unknown. Reference: SU001; master line 1099.

Master work or verification: Keep boundary across new intake, export and host integration.

Expected check: No export/download/automation triggers third-party submission.

Manual Mark submitted remains available after download and on returning later. G V6/S16.

Evidence: Not examined in this run; current implementation unknown. Reference: SU002; master line 1100.

Master work or verification: Verify route/navigation visibility without requiring re-export.

Expected check: Reopen app and record actual submission independently of downloading again.

Submitted status requires explicit user confirmation, not export or receipt alone. G V14.

Evidence: Not examined in this run; current implementation unknown. Reference: SU003; master line 1101.

Master work or verification: Expand dialog to selected materials without inferring external success.

Expected check: Download/receipt upload alone leaves not-submitted; confirmed event attributed.

User chooses exact Beedy versions actually submitted rather than implicitly latest draft. G V14.

Evidence: Examined gap or blocker remains in the supplied evidence. Reference: SU004; master line 1102.

Examined ledger finding: queued N-D04 (D-04, 4 Nov). Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: Add submitted-set selection over answer/document history.

Expected check: Select older version; later working edit neither changes selection nor snapshot.

User can upload actual externally edited/final files. G V14; D §11A.

Evidence: Built and reviewed for int-b7; not yet merged. Reference: SU005; master line 1103.

Master work or verification: Add retained final-file ingestion under selected custody policy.

Expected check: Actual final bytes/hash preserved, including differences from Beedy export.

Submitted package identifies exact attachment versions/bytes, not mutable pointers or metadata alone. D §11A; G V14.

Evidence: Reported whole implementation merged; acceptance remains. Reference: SU006; master line 1104.

Master work or verification: Stage/version permitted attachment bytes and manifest.

Expected check: Later remote replacement/deletion cannot silently change recorded submitted package.

Preserve immutable answers, budget, accepted plan, brief and facts as submitted. D §11A; G V14.

Evidence: Not examined in this run; current implementation unknown. Reference: SU007; master line 1105.

Master work or verification: Retain existing immutable copy, extend with selected-set manifest rather than replace.

Expected check: Existing sent-copy regression plus version/file selection cases.

Seal package only after hashes/access validated, with attempt-idempotent atomic record. D §11A/§13A.

Evidence: Reported whole implementation merged; acceptance remains. Reference: SU008; master line 1106.

Master work or verification: Add staged blobs/manifest/seal transaction and operation identity.

Expected check: Duplicate confirmation returns same attempt; incomplete file staging not sealed.

Record reported time/timezone, actor, requirements/budget/commitment versions, render policy and relevant approvals. D §11A.

Evidence: Not examined in this run; current implementation unknown. Reference: SU009; master line 1107.

Master work or verification: Expand exact manifest metadata only where missing.

Expected check: Reconstruct reported event and package basis without claiming independent verification.

External submission is user-reported unless separately evidenced. D §11A; G V14.

Evidence: Not examined in this run; current implementation unknown. Reference: SU010; master line 1108.

Master work or verification: Preserve event basis/evidence label separately from receipt availability.

Expected check: Manual report remains factual report, not system-confirmed funder acceptance.

A real external submission remains recordable despite unresolved readiness items. D §1C lines183-185, §10C lines906-908; G V13 blocks Ready only.

Evidence: Reported whole implementation merged; acceptance remains. Reference: SU011; master line 1109.

Master work or verification: Separate Ready gate from factual event-record command; preserve unresolved gaps and attestation.

Expected check: Not-Ready app records actual reported submission without becoming falsely Ready.

Failure to capture after actual submission preserves reported-event/capture-incomplete state and retry list. D §11A/§13A.

Evidence: Not examined in this run; current implementation unknown. Reference: SU012; master line 1110.

Master work or verification: Persist reported event independently of complete package sealing.

Expected check: Storage outage cannot erase truth; missing files explicit and retryable.

Receipt is optional. G V14.

Evidence: Not examined in this run; current implementation unknown. Reference: SU013; master line 1111.

Master work or verification: Preserve receipt-free recording; add optional receipt association.

Expected check: No-receipt user confirms actual set successfully.

Receipt upload asks which materials were used and links receipt to confirmed set without auto-marking submitted. G V14.

Evidence: Not examined in this run; current implementation unknown. Reference: SU014; master line 1112.

Master work or verification: Add receipt→select/upload→confirm→link sequence.

Expected check: Receipt alone causes no submitted transition; wrong set can be corrected with history.

Mistaken submitted-file record can be corrected by authorized user with original retained. G V19; D §11A.

Evidence: Reported whole implementation merged; acceptance remains. Reference: SU015; master line 1113.

Master work or verification: Append linked correction record instead of editing original snapshot.

Expected check: Original and corrected sets both inspectable with actor/time/reason where supplied.

Correcting historical record does not change later working draft or assert a new funder submission. G V19.

Evidence: Reported whole implementation merged; acceptance remains. Reference: SU016; master line 1114.

Master work or verification: Distinguish correction event from revision/resubmission action.

Expected check: Correction leaves current draft and submission chronology unchanged.

Admin may delegate submission recording separately from editing and final approval. G V31.

Evidence: Reported whole implementation merged; acceptance remains. Reference: SU027; master line 1125.

Master work or verification: Add specific scoped recording grant, not blanket editor privilege.

Expected check: Delegated grantwriter records set without edit/final-approve authority or ED participation.

Recording rechecks current grant and preserves actor; it does not fabricate approval or authorize external submission. G V31.

Evidence: Reported whole implementation merged; acceptance remains. Reference: SU029; master line 1127.

Master work or verification: Check recording grant at mutation and revoke stale-session capability.

Expected check: Revoked grant denied; event cannot set approval signature or contact funder.

Actual external submission may be truthfully recorded with unresolved items; Ready gate is not a record-of-fact ban. D1C lines183-185; D10C906-908; PG V31

Evidence: Reported whole implementation merged; acceptance remains. Reference: AP26; master line 1562.

Master work or verification: Separate submission-record grant/fact capture from Ready qualification

Expected check: authorized reported submission with documented gaps persists

Dependency or boundary: ID/OUT/REV

Mark submitted remains available after download and on return. PG V6/V14

Evidence: Not examined in this run; current implementation unknown. Reference: EX14; master line 1584.

Master work or verification: Verify return navigation and resumable handoff without auto-trigger

Expected check: leave/return fixture

Dependency or boundary: OUT/DOC

Submission confirmation names actual materials, not merely application. PG V14; D11A

Evidence: Not examined in this run; current implementation unknown. Reference: EX15; master line 1585.

Master work or verification: Require final selected set confirmation

Expected check: confirmation displays filenames/versions

Dependency or boundary: OUT/DOC

User may select older Beedy-provided versions actually submitted. PG V14

Evidence: Not examined in this run; current implementation unknown. Reference: EX16; master line 1586.

Master work or verification: Version history feeds submission-set picker

Expected check: select older, preserve newer working draft

Dependency or boundary: DOC/OUT

User may upload externally finalized actual submitted files. PG V14

Evidence: Not examined in this run; current implementation unknown. Reference: EX17; master line 1587.

Master work or verification: Bounded storage/upload/capture path under current policy

Expected check: external-final-file fixture

Dependency or boundary: OUT/ID/POLICY

Ask whether portal edits/final files differ; never assume newest draft was submitted. D11A; PG V14

Evidence: Not examined in this run; current implementation unknown. Reference: EX18; master line 1588.

Master work or verification: Explicit actual-materials choice, not live-pointer capture

Expected check: divergent portal text fixture

Dependency or boundary: OUT/DOC

Submitted set is preserved separately from all later drafts. D11A; PG V14

Evidence: Not examined in this run; current implementation unknown. Reference: EX19; master line 1589.

Master work or verification: Extend existing frozen copy, do not replace it

Expected check: later edit leaves original unchanged

Dependency or boundary: OUT/DOC

Submitted attachment bytes/hashes, not mutable pointers, are preserved. D11A

Evidence: Reported whole implementation merged; acceptance remains. Reference: EX20; master line 1590.

Master work or verification: Authorized immutable copies/hash checks under custody policy

Expected check: mutate external file after submission

Dependency or boundary: OUT/ID/POLICY

Submitted manifest captures requirements/budget/commitments/render policy/relevant approvals. D11A

Evidence: Not examined in this run; current implementation unknown. Reference: EX21; master line 1591.

Master work or verification: Extend manifest with exact dependency versions

Expected check: manifest completeness inspection

Dependency or boundary: OUT/REV/REQ

Reported submission time/timezone and acting user are retained. D11A; PG S16/S17

Evidence: Not examined in this run; current implementation unknown. Reference: EX22; master line 1592.

Master work or verification: Preserve explicit report and attribution, not inferred portal proof

Expected check: non-UTC submission fixture

Dependency or boundary: OUT/ID

Receipt is optional and receipt upload alone does not establish submitted status. PG V14

Evidence: Not examined in this run; current implementation unknown. Reference: EX23; master line 1593.

Master work or verification: Optional link to already confirmed actual set

Expected check: receipt-only remains unsubmitted

Dependency or boundary: OUT

On receipt upload, identify/select/upload actual used documents and confirm linkage. PG V14

Evidence: Not examined in this run; current implementation unknown. Reference: EX24; master line 1594.

Master work or verification: Simple receipt-to-set confirmation, not mailbox automation

Expected check: receipt tied to older version

Dependency or boundary: OUT/DOC

Stage verified blobs then atomically seal submission manifest; deduplicate per attempt. D11A

Evidence: Reported whole implementation merged; acceptance remains. Reference: EX25; master line 1595.

Master work or verification: Extend atomic seal for actual bytes and idempotent attempt key

Expected check: duplicate click/storage failure T09

Dependency or boundary: OUT

External submission fact survives capture/storage failure as capture-incomplete with missing items/retry. D11A

Evidence: Not examined in this run; current implementation unknown. Reference: EX26; master line 1596.

Master work or verification: Persist truthful reported event before complete capture is possible

Expected check: fail blob storage after external submission

Dependency or boundary: OUT/ID

Later evidence supplements submission record with provenance/time, never rewrites sealed set. D11A

Evidence: Not examined in this run; current implementation unknown. Reference: EX27; master line 1597.

Master work or verification: Append supplement/correction linkage

Expected check: late receipt retains original hash

Dependency or boundary: OUT

Authorized correction fixes mistakenly recorded files while retaining original/history/actor. PG V19

Evidence: Reported whole implementation merged; acceptance remains. Reference: EX28; master line 1598.

Master work or verification: Linked corrected set, no silent overwrite

Expected check: correct wrong file/deny unauthorized correction

Dependency or boundary: OUT/ID

Admin may separately delegate submission/outcome recording, without edit/final-approval rights or ED session. PG V31

Evidence: Reported whole implementation merged; acceptance remains. Reference: EX32; master line 1602.

Master work or verification: Independent scoped grant, actual actor attribution

Expected check: recorder-only staff/grantwriter PT12

Dependency or boundary: ID/OUT

Revoking recording grant blocks next action but leaves independent grants unchanged. PG V31/PT14

Evidence: Reported whole implementation merged; acceptance remains. Reference: EX33; master line 1603.

Master work or verification: Current grant at record effect and scoped revocation

Expected check: queued/reopened record attempt denied

Dependency or boundary: ID/OUT

Admin can delegate submission/outcome recording separately from edit/final-approval authority.

Evidence: Not examined in this run; current implementation unknown. Reference: IAM-012; master line 1913.

Master work or verification: Distinct recording capability; no ED session dependency.

Expected check: Staff grantwriter can record with grant and without edit/approve; editor without grant cannot.

Record and compare revised submissions

Traceability group F14; capability.

Scope connection: Separate linked submission and expandable differences, with private comparison and sharing safeguards. A distinct new submission attempt with comparison, preserving both packages/dates and private optional reasons.

Evidence in this group: 8 unexamined in this run.

Genuine revised submission gets separate linked record retaining both packages/dates. G V21.

Evidence: Not examined in this run; current implementation unknown. Reference: SU017; master line 1115.

Master work or verification: Add linked submission-attempt records; app schema choice remains engineering.

Expected check: Two actual submissions remain independently verifiable with correct dates.

User gets expandable difference overview for linked submissions. G V21.

Evidence: Not examined in this run; current implementation unknown. Reference: SU018; master line 1116.

Master work or verification: Compare package manifests and content using retained version history.

Expected check: Added/removed/changed material shown; original sets unchanged.

Change explanation is optional; comparison works without it. G V21.

Evidence: Not examined in this run; current implementation unknown. Reference: SU019; master line 1117.

Master work or verification: Optional note field, no forced narrative disclosure.

Expected check: Empty reason accepted and comparison remains usable.

Comparison and reasons are organization-private by default. G V21.

Evidence: Not examined in this run; current implementation unknown. Reference: SU020; master line 1118.

Master work or verification: Apply private ownership and current membership on comparison data.

Expected check: Other tenant/Centring default access denied.

Centring improvement sharing needs explicit scoped opt-in; not training or underlying-package sharing authority. G V21.

Evidence: Not examined in this run; current implementation unknown. Reference: SU021; master line 1119.

Master work or verification: Separate permission grant and data payload from ordinary comparison storage.

Expected check: No opt-in means no share; narrow consent never exports full packages or enables training.

Genuine resubmission is a second linked record preserving both packages and dates. PG V21

Evidence: Not examined in this run; current implementation unknown. Reference: EX29; master line 1599.

Master work or verification: Bounded attempt/linked-submission model, not necessarily second full app

Expected check: genuine revised submission fixture

Dependency or boundary: OUT/REQ

Resubmission comparison is expandable and explanation optional. PG V21

Evidence: Not examined in this run; current implementation unknown. Reference: EX30; master line 1600.

Master work or verification: Version comparison over retained packages; no compulsory note

Expected check: no-reason resubmission

Dependency or boundary: OUT/DOC

Comparison/reasons are organization-private unless explicit Centring-improvement opt-in. PG V21

Evidence: Not examined in this run; current implementation unknown. Reference: EX31; master line 1601.

Master work or verification: Per-purpose consent, not blanket package sharing/training grant

Expected check: no-opt-in sends nothing

Dependency or boundary: OUT/POLICY/ID

Record application outcomes

Traceability group F15; capability.

Scope connection: Optional awarded/not-funded/declined states, amount and reason are variants of one outcome record. One optional outcome-recording operation; unknown/not funded/declined/accepted and optional reason are states, not separate features.

Evidence in this group: 1 pre-existing locally verified; 8 whole merged; 2 unexamined in this run.

Outcome reporting is customer-optional and unknown/unreported until supplied. G V18.

Evidence: Pre-existing behavior verified locally; acceptance remains. Reference: SU022; master line 1120.

Master work or verification: Define explicit unknown state independent of elapsed time/submission.

Expected check: Silence never becomes rejection/award; user can leave outcome unset.

User can report not funded. G V18.

Evidence: Reported whole implementation merged; acceptance remains. Reference: SU023; master line 1121.

Master work or verification: Retain choice while removing compulsory reason.

Expected check: Not-funded event attributed without requiring sensitive explanation.

User can report awarded/accepted and amount where supplied. G V18.

Evidence: Reported whole implementation merged; acceptance remains. Reference: SU024; master line 1122.

Master work or verification: Verify optional amount/acceptance semantics rather than equate all awards with acceptance.

Expected check: Accepted award preserves user-supplied amount/evidence; no inferred receipt.

User can report awarded but declined by organization. G V18.

Evidence: Reported whole implementation merged; acceptance remains. Reference: SU025; master line 1123.

Master work or verification: Add distinct bounded outcome without full post-award workflow.

Expected check: Award-offered/declined differs from funder rejection and accepted award.

Decline reason is optional. G V18.

Evidence: Reported whole implementation merged; acceptance remains. Reference: SU026; master line 1124.

Master work or verification: Update command/schema/UI/test to allow absent reason.

Expected check: Both rejection and awarded-declined recording work without forced note.

Admin may delegate outcome recording separately from editing/final approval. G V31.

Evidence: Reported whole implementation merged; acceptance remains. Reference: SU028; master line 1126.

Master work or verification: Enforce independently scoped outcome-record permission.

Expected check: Staff with outcome grant succeeds; editor without grant denied.

Submitted proposal is evidence of proposal, not proof of awarded funding or factual accuracy. W Q38; D §12; G V18.

Evidence: Not examined in this run; current implementation unknown. Reference: SU035; master line 1133.

Master work or verification: Preserve when reusing submission as program context.

Expected check: Imported submission does not become award/received cash or verified program result.

Withdraw/decline reason is optional under relevant latest choices, not a required typed blocker. G V18/V22; A C1.

Evidence: Reported whole implementation merged; acceptance remains. Reference: LC030; master line 1092.

Master work or verification: Separate action semantics and permit blank optional reason.

Expected check: Archive/no-longer-pursue and outcome choice work without forced disclosure.

Outcome recording capability exists; reporting itself is optional with unknown default. PG V18

Evidence: Not examined in this run; current implementation unknown. Reference: EX34; master line 1604.

Master work or verification: Preserve unknown until supplied, not forced response or silence inference

Expected check: unreported case remains unknown

Dependency or boundary: OUT

Outcomes distinguish not funded, awarded-but-declined and awarded/accepted. PG V18

Evidence: Reported whole implementation merged; acceptance remains. Reference: EX35; master line 1605.

Master work or verification: Add intended distinction without full post-award module

Expected check: three supplied outcomes round-trip

Dependency or boundary: OUT

Decline reason is optional. PG V18

Evidence: Reported whole implementation merged; acceptance remains. Reference: EX36; master line 1606.

Master work or verification: Remove mandatory-note gate for optional outcome reporting

Expected check: blank-reason decline saves

Dependency or boundary: OUT

Draft and retain outcome-linked feedback

Traceability group F16; capability.

Scope connection: Feedback-request draft and attributed private reply are one feedback loop, not automatic outreach. Prepare policy-aware human-reviewed questions where eligibility evidence is missing or an outcome warrants feedback. Sending/sharing requires separate permission and is not silently included. One bounded feedback loop: request draft and contextual feedback record, respecting no-contact policies and independent send/share permissions.

Evidence in this group: 10 unexamined in this run.

Known success or rejection can offer an outcome-linked feedback-request draft. G F1/S16/§23; D §12A.

Evidence: Not examined in this run; current implementation unknown. Reference: SU030; master line 1128.

Master work or verification: Add bounded draft kind over existing drafter; do not delete requirement as post-award.

Expected check: Success asks strengths/fit, rejection improvements, correct app/round attribution.

No-contact/no-feedback funder policy suppresses feedback-request offer. G F1; D §12A.

Evidence: Not examined in this run; current implementation unknown. Reference: SU031; master line 1129.

Master work or verification: Source-backed communication-policy check before offer.

Expected check: Explicit no-feedback source produces no inappropriate draft offer.

Drafting, sending and sharing feedback replies are distinct permissions; no automatic outreach/mailbox integration. G F1; D §12A.

Evidence: Not examined in this run; current implementation unknown. Reference: SU032; master line 1130.

Master work or verification: Keep draft local; separate explicit send authority if supported.

Expected check: Draft generates no message; share requires separate scoped permission.

Feedback is private, attributed by application/round/source/date, direct feedback distinguished from inference. G F1/§23; D §12A.

Evidence: Not examined in this run; current implementation unknown. Reference: SU033; master line 1131.

Master work or verification: Reuse exchanges, add correct application/round link and observation kind.

Expected check: Direct quote, inferred pattern and reported reason have distinct labels/history.

No feedback reply is neutral, not a negative signal or proof of writing quality. G F1; D §12A.

Evidence: Not examined in this run; current implementation unknown. Reference: SU034; master line 1132.

Master work or verification: Avoid no-reply learning label; preserve unknown.

Expected check: Timeout/silence creates no negative rank or fact.

Success/rejection can offer policy-aware feedback-request drafts.

Evidence: Not examined in this run; current implementation unknown. Reference: PE19; master line 650.

Master work or verification: P4/drafting: bounded outcome-linked draft with funder no-contact/no-feedback suppression.

Expected check: Both outcomes offer appropriate draft; prohibited-contact policy suppresses it.

Dependency or boundary: Not separately assessed in A; absence of F1 row is not proof missing.

Drafting, sending and Centring sharing permissions are separate; no reply neutral.

Evidence: Not examined in this run; current implementation unknown. Reference: PE20; master line 651.

Master work or verification: P4/privacy: separate purpose grants; attributed reply storage and no-reply state.

Expected check: Prepare draft without send; send choice grants no sharing; silence creates no rejection inference.

Dependency or boundary: No automatic outreach or training permission follows draft/send consent.

After success or rejection, offer feedback-request draft unless funder no-contact/no-feedback policy. D12A/T10; PG F1/S16

Evidence: Not examined in this run; current implementation unknown. Reference: EX37; master line 1607.

Master work or verification: Bounded outcome/round-based draft and policy suppression

Expected check: success/rejection/no-contact fixtures

Dependency or boundary: OUT/REQ/FACT

Feedback draft/send/reply-sharing are independent permissions; no automatic outreach. D12A; PG F1

Evidence: Not examined in this run; current implementation unknown. Reference: EX38; master line 1608.

Master work or verification: No automatic send; separately authorized action/attributed external send

Expected check: T10 independent permission matrix

Dependency or boundary: ID/POLICY

Feedback retains application/round/source/date and direct-versus-inferred distinction; no reply neutral. D12A; PG S18

Evidence: Not examined in this run; current implementation unknown. Reference: EX39; master line 1609.

Master work or verification: Attribute reply; preserve privacy, do not infer rejection from silence

Expected check: T10 no-reply and attributed reply

Dependency or boundary: FACT/OUT

Approve the current application package

Traceability group F50; capability.

Scope connection: One version-bound organizational approval capability including delegated/sole/conditional approval and mobile access. Quorum choices, freshness checks and revocation are variants/safeguards, not extra features. Exact-package final approval is one capability across mobile and desktop; sole-owner and delegate variants do not add features. Merge with drafting approval.

Evidence in this group: 27 unexamined in this run; 1 whole merged.

Mobile review/decisions synchronize without overwriting newer desktop state. PG V15/V32

Evidence: Not examined in this run; current implementation unknown. Reference: ED60; master line 1531.

Master work or verification: Exact revision checks and tested mobile/desktop handoff

Expected check: two-device stale decision fixture

Dependency or boundary: DOC/REV/ID

Review completion, organizational approval, external authorization and Ready remain distinct. D10; PG S15

Evidence: Not examined in this run; current implementation unknown. Reference: AP01; master line 1537.

Master work or verification: Separate indicators and authority, not universal Approved badge

Expected check: PT10/T09 state matrix

Dependency or boundary: REV/REQ

Staff draft/edit does not grant final organizational approval. PG V13; D2A

Evidence: Not examined in this run; current implementation unknown. Reference: AP05; master line 1541.

Master work or verification: Enforce separate capabilities on every path

Expected check: writer denied final approval

Dependency or boundary: ID/REV

Admin or explicitly delegated approver may final-approve. PG V13

Evidence: Not examined in this run; current implementation unknown. Reference: AP06; master line 1542.

Master work or verification: Add named/scoped grant using existing roles, not inferred title power

Expected check: delegate grant/revoke matrix

Dependency or boundary: ID/REV

Sole owner may write and approve without compulsory second person. PG V13

Evidence: Not examined in this run; current implementation unknown. Reference: AP07; master line 1543.

Master work or verification: Preserve sole-owner path under selected policy

Expected check: single-user PT10

Dependency or boundary: ID/REV

Display title alone confers no approval authority. D2A; PG4.2/V13

Evidence: Not examined in this run; current implementation unknown. Reference: AP08; master line 1544.

Master work or verification: Replace title checks with explicit effective grants

Expected check: same title without grant denied

Dependency or boundary: ID/POLICY

Effective role tenure preserves historical authority; departed user cannot act again. D2A/10B

Evidence: Not examined in this run; current implementation unknown. Reference: AP09; master line 1545.

Master work or verification: Record actor/policy/grant/time; preserve history after revocation

Expected check: former approver/history test

Dependency or boundary: ID/REV

Role policy can represent any/designated/distinct-person quorum and co-executives; exact selected domains/quorum remain open. D10B; PG V13

Evidence: Not examined in this run; current implementation unknown. Reference: AP10; master line 1546.

Master work or verification: Keep representation requirement; do not impose new launch quorum defaults

Expected check: T08 once selected policy known

Dependency or boundary: POLICY/ID

Approval binds policy and material dependency manifest including relevant budget/plan/attachments/deadline. D10B; PG S15

Evidence: Not examined in this run; current implementation unknown. Reference: AP11; master line 1547.

Master work or verification: Expand exact manifest, not only text hash

Expected check: modify each dependency T08

Dependency or boundary: REV/FACT/REQ/OUT

Capture/hash/check under consistent concurrency guard so wrong-version approval cannot commit. D10B; PG S15

Evidence: Not examined in this run; current implementation unknown. Reference: AP12; master line 1548.

Master work or verification: Lock or equivalent consistent read before hash/commit

Expected check: concurrent approval/edit test

Dependency or boundary: REV/DOC

Material change makes current Ready/approval applicability stale while preserving historical approval. D10B; PG S15

Evidence: Reported whole implementation merged; acceptance remains. Reference: AP13; master line 1549.

Master work or verification: Reevaluate only affected manifest/material domains

Expected check: material-edit PT10

Dependency or boundary: REV/DOC/FACT

Cosmetic edits do not require renewed approval when equivalence recorded. D10B

Evidence: Not examined in this run; current implementation unknown. Reference: AP14; master line 1550.

Master work or verification: Distinguish cosmetic from numeric/negation/commitment changes

Expected check: T04/T08 cosmetic versus material pair

Dependency or boundary: REV

Cross-domain changes route to affected reviewers; fundamental scope changes to go/no-go authority. D10B

Evidence: Not examined in this run; current implementation unknown. Reference: AP15; master line 1551.

Master work or verification: Dependency-based routing under selected policy

Expected check: finance-to-program scope change

Dependency or boundary: REV/ID/POLICY

Conditional approval stores exact condition/comments and version. D10B lines880-882

Evidence: Not examined in this run; current implementation unknown. Reference: AP16; master line 1552.

Master work or verification: Preserve bounded condition rather than blanket approval

Expected check: pending-condition record inspection

Dependency or boundary: REV

Objective accepted change may fulfill explicit condition with predicate/result/revision/actor/time. D10B

Evidence: Not examined in this run; current implementation unknown. Reference: AP17; master line 1553.

Master work or verification: Implement only policy-permitted explicit predicates

Expected check: condition-satisfied T08

Dependency or boundary: REV/DOC

Ambiguous/subjective condition fulfillment returns to approver. D10B

Evidence: Not examined in this run; current implementation unknown. Reference: AP18; master line 1554.

Master work or verification: Prevent model declaring subjective consent fulfilled

Expected check: ambiguous condition remains pending

Dependency or boundary: REV/ID

Executive override records authorized scope/actor/reason/version, never another person's signature. D10B

Evidence: Not examined in this run; current implementation unknown. Reference: AP19; master line 1555.

Master work or verification: Verify permitted policy and attributed offline reports

Expected check: override cannot forge finance approval

Dependency or boundary: REV/ID/POLICY

Fresh named host snapshot shown before approval/readiness. D10B; PG S15

Evidence: Not examined in this run; current implementation unknown. Reference: AP20; master line 1556.

Master work or verification: Snapshot and dependency vector before approval

Expected check: host edited before approval

Dependency or boundary: HOST/BIND/REV

Unknown later host freshness shows sync-required/unknown applicability, historical snapshot approval retained. D10B

Evidence: Not examined in this run; current implementation unknown. Reference: AP21; master line 1557.

Master work or verification: Invalidate current applicability without erasing prior approval

Expected check: unseen host edit and disconnected test

Dependency or boundary: HOST/REV

Authorized mobile final approval binds reviewed current package and current rights. PG V32; N current checkpoint

Evidence: Not examined in this run; current implementation unknown. Reference: AP27; master line 1563.

Master work or verification: Implement/test mobile current-package review and exact revision binding

Expected check: PT10/PT18 mobile approval

Dependency or boundary: ID/REV/DOC

Stale mobile package or revoked approval right cannot approve newer/unreviewed material. PG V32

Evidence: Not examined in this run; current implementation unknown. Reference: AP28; master line 1564.

Master work or verification: Reject stale/revoked action with preserved reviewed snapshot

Expected check: concurrent desktop edit/mobile approval

Dependency or boundary: REV/ID

Internal/mobile approval never submits to funder. PG V32; D10

Evidence: Not examined in this run; current implementation unknown. Reference: AP29; master line 1565.

Master work or verification: Preserve no-submission invariant when adding mobile approval

Expected check: approval invokes no external send

Dependency or boundary: ID/OUT

Final organization approval is restricted to admin or explicitly delegated approver.

Evidence: Not examined in this run; current implementation unknown. Reference: IAM-008; master line 1909.

Master work or verification: Replace conflicting title authority; bind to current scope/rights.

Expected check: Unauthorized editor denied; named approver/admin allowed for exact current package.

Sole owner may draft and approve; no invented mandatory second person.

Evidence: Not examined in this run; current implementation unknown. Reference: IAM-009; master line 1910.

Master work or verification: Verify survives revised explicit grants and version binding.

Expected check: Single-person organization completes authorized workflow without synthetic second approver.

Approval records bind actor, effective authority and exact reviewed package/revisions.

Evidence: Not examined in this run; current implementation unknown. Reference: IAM-010; master line 1911.

Master work or verification: Tie exact content/requirements/dependencies to decision; materiality details remain bounded.

Expected check: Material edit makes prior approval noncurrent, immutable attribution/history retained.

Mobile authorized final approval requires review of the current package under the same rights/revision checks.

Evidence: Not examined in this run; current implementation unknown. Reference: IAM-011; master line 1912.

Master work or verification: Reuse approval contract; required companion layout validation.

Expected check: Phone-sized current-package review plus stale/unauthorized denial and desktop synchronization.

Authorized mobile approvers can give final organization approval after reviewing current package.

Evidence: Not examined in this run; current implementation unknown. Reference: UXM009; master line 2311.

Master work or verification: Mobile whole-package review and revision-bound approval; dependency M22 repair, not a deferred enhancement.

Mobile final approval never submits externally to a funder.

Evidence: Not examined in this run; current implementation unknown. Reference: UXM010; master line 2312.

Master work or verification: Negative external-effect assertion in mobile approval test; generic no-submit boundary is reported.

Export a clean application package

Traceability group F51; capability.

Scope connection: One clean output/download outcome across formats and readiness states, with tested fidelity, rights, limits, partial recovery and explicit human-submission boundary.

Evidence in this group: 10 unexamined in this run; 2 whole merged; 1 pre-existing locally verified.

Produce clean customer-facing application output from captured document revision. D9C/T11; PG S16

Evidence: Not examined in this run; current implementation unknown. Reference: EX01; master line 1571.

Master work or verification: Reuse renderer with manifest/preflight and reachable clean-output action

Expected check: PT12 clean corpus

Dependency or boundary: DOC/OUT

Export preserves intentional/funder-required references and bibliographies. D6C/9C/T11; PG PT12

Evidence: Reported whole implementation merged; acceptance remains. Reference: EX02; master line 1572.

Master work or verification: Remove internal evidence furniture only, not authored citations

Expected check: intentional versus internal citation fixture

Dependency or boundary: OUT/FACT

Export removes internal markers/comments/tracked changes/controlled hidden metadata and source IDs/support links. D9C/T11; PG S16/PT12

Evidence: Reported whole implementation merged; acceptance remains. Reference: EX03; master line 1573.

Master work or verification: Explicit residue policy and package inspection

Expected check: metadata/OOXML/render checks

Dependency or boundary: OUT

Clean output validates structure/hash/metadata before success. D11A; PG S16

Evidence: Not examined in this run; current implementation unknown. Reference: EX04; master line 1574.

Master work or verification: Deterministic artifact checks with explicit failure state

Expected check: corruption/hidden-text fixture

Dependency or boundary: OUT/DOC

Export preflight uses captured revision's limits/render profile and attachment versions. D5A/T11; PG S16

Evidence: Not examined in this run; current implementation unknown. Reference: EX05; master line 1575.

Master work or verification: Capture one input vector and validate exact output

Expected check: edit-during-export fixture

Dependency or boundary: REQ/OUT

Supported formats and host fidelity limits are declared from tested implementation, not invented. PG S16; D9B

Evidence: Not examined in this run; current implementation unknown. Reference: EX06; master line 1576.

Master work or verification: Select finite output support and prove each path

Expected check: named format corpus

Dependency or boundary: OUT/HOST

Ready-to-submit view and downloadable answers/checklist share same source. PG V6/V14/S16

Evidence: Not examined in this run; current implementation unknown. Reference: EX07; master line 1577.

Master work or verification: One manifest feeding in-app view and downloads

Expected check: compare checklist/view/export

Dependency or boundary: OUT/REQ

Non-ready draft download remains possible with actual warnings. PG V13/S15

Evidence: Not examined in this run; current implementation unknown. Reference: EX08; master line 1578.

Master work or verification: Separate export permission from Ready, preserve warning labels

Expected check: over-limit draft downloads without Ready

Dependency or boundary: OUT/ID

Exhausted allowance does not block authorized nonmetered export. PG S12/S16/PT11

Evidence: Not examined in this run; current implementation unknown. Reference: EX09; master line 1579.

Master work or verification: Carry zero-cost export through new output path

Expected check: zero allowance export

Dependency or boundary: OUT/ID

Export rechecks current document/attachment/export rights independently from drafting rights. PG S16; D14A

Evidence: Not examined in this run; current implementation unknown. Reference: EX10; master line 1580.

Master work or verification: Current source and selected-file permission check at effect

Expected check: revoked attachment before generation

Dependency or boundary: OUT/ID

Partial export identifies missing pieces and reuses verified completed parts without duplicate replay. PG S16

Evidence: Not examined in this run; current implementation unknown. Reference: EX11; master line 1581.

Master work or verification: Durable artifact/receipt state and scoped retry

Expected check: failure between attachments, retry fixture

Dependency or boundary: OUT

Export/download alone never marks application submitted. PG V6/V14; D11A

Evidence: Pre-existing behavior verified locally; acceptance remains. Reference: EX12; master line 1582.

Master work or verification: Preserve invariant when adding clean output

Expected check: export then inspect stage

Dependency or boundary: OUT

Only human submits externally; Beedy does not portal-fill/sign/send submission. PG §2.2/V14; D1/11A

Evidence: Not examined in this run; current implementation unknown. Reference: EX13; master line 1583.

Master work or verification: Keep separate manual handoff and recorded fact

Expected check: no outbound submit action

Dependency or boundary: OUT/ID

Reminders notifications and work controls

Configure deadline and review reminders

Traceability group F17; capability.

Scope connection: Timing/recipient/fallback/suspension are variants of one reminder capability; catch-up remains undecided. Optional user-selected document-maintenance reminder schedules are one capability. One deadline-reminder capability includes the settled four offsets, adjustable settings, archive suspension and recipient fallback. Missed-trigger catch-up remains open. User-chosen document review reminders are explicitly distinct from automatic application deadline reminders; no blocking navigation.

Evidence in this group: 30 unexamined in this run; 3 residual examined missing or blocked.

Pursue automatically enables application deadline reminders. G V30 supersedes earlier open cadence.

Evidence: Not examined in this run; current implementation unknown. Reference: NT001; master line 1140.

Master work or verification: Add explicit reminder enrollment in pursuit transaction with durable identity.

Expected check: One successful Pursue enables once; Save/new-round display does not.

Default includes one calendar month before deadline, not fixed 30 days. G V30.

Evidence: Not examined in this run; current implementation unknown. Reference: NT002; master line 1141.

Master work or verification: Calendar-aware offset; exact month-end/timezone policy needs engineering definition.

Expected check: February/month-end cases verify calendar-month semantics.

Default includes two weeks before deadline. G V30.

Evidence: Not examined in this run; current implementation unknown. Reference: NT003; master line 1142.

Master work or verification: Persist separate two-week trigger.

Expected check: Fixture emits exactly one eligible scheduled event.

Default includes one week before deadline. G V30.

Evidence: Not examined in this run; current implementation unknown. Reference: NT004; master line 1143.

Master work or verification: Persist separate one-week trigger.

Expected check: Fixture emits exactly one eligible scheduled event.

Default includes two days before deadline. G V30.

Evidence: Not examined in this run; current implementation unknown. Reference: NT005; master line 1144.

Master work or verification: Persist separate two-day trigger with honest deadline precision.

Expected check: Trigger does not invent a timezone/closing time.

Users can adjust deadline-reminder timing and frequency in Settings. G V30/S22.

Evidence: Not examined in this run; current implementation unknown. Reference: NT006; master line 1145.

Master work or verification: Add preferences to same notification owner.

Expected check: Change/reload affects future eligible events without duplicate old timers.

Archive suspends application deadline reminders until Resume. G V26/V30.

Evidence: Not examined in this run; current implementation unknown. Reference: NT007; master line 1146.

Master work or verification: Cancel/fence pending app deadline notifications when archived.

Expected check: Archived event suppressed even if queued before archive; resumed scope explicit.

Unassigned-app deadline/action-needed emails go to creator. G V27.

Evidence: Not examined in this run; current implementation unknown. Reference: NT008; master line 1147.

Master work or verification: Resolve current creator recipient without silently assigning owner.

Expected check: Unassigned app delivers only to allowed creator under preferences.

If creator loses access, authorized org admin is fallback; revoked creator never receives app mail. G V27.

Evidence: Not examined in this run; current implementation unknown. Reference: NT009; master line 1148.

Master work or verification: Recheck before send and choose authorized admin deterministically.

Expected check: Revocation between schedule/send prevents stale-recipient disclosure.

Missed-trigger catch-up remains unanswered; no immediate send, skip or batch policy may be inferred. G V30/Remaining closure.

Evidence: Not examined in this run; current implementation unknown. Reference: NT010; master line 1149.

Master work or verification: Keep policy decision explicit before missed-trigger behavior released.

Expected check: Test scenarios await selected rule; no invented default reported as approved.

Optional document-review reminders are separate, user-chosen after-batch review with Not now/later and no block. W Q32; G §23.

Evidence: Not examined in this run; current implementation unknown. Reference: NT014; master line 1153.

Master work or verification: Add optional batch list over document dates; no blanket yearly expiration.

Expected check: User skips and returns later; app deadline settings do not alter document reminders.

Pursue enables deadline reminders without starting paid drafting. PG V30/S07/S22, PT05/PT15

Evidence: Not examined in this run; current implementation unknown. Reference: LC15; master line 1782.

Master work or verification: Separate preparation, reminder enrollment and explicitly initiated paid run.

Expected check: Pursue creates preparation/reminder configuration and records zero drafting spend.

Dependency or boundary: REQ/RUN/ID

Deadline defaults are one calendar month, two weeks, one week and two days; user adjusts settings. PG V30, PT15

Evidence: Not examined in this run; current implementation unknown. Reference: LC16; master line 1783.

Master work or verification: Implement named offsets with calendar-month arithmetic and Settings controls.

Expected check: Month-end and short-month deadline cases differ correctly from fixed 30 days; saved changes survive reopen.

Dependency or boundary: REQ/POLICY

Archive suspends deadline reminders until resume; missed-trigger catch-up is unresolved. PG V26/V30, PT15

Evidence: Not examined in this run; current implementation unknown. Reference: LC17; master line 1784.

Master work or verification: Gate reminders on archive state; obtain catch-up policy before claiming its behavior.

Expected check: Archived due trigger sends nothing; resume uses approved policy without assumed immediate backfill.

Dependency or boundary: RUN/REQ/POLICY

Unowned application emails go to creator, then authorized admin if creator loses access. PG V27, PT15

Evidence: Not examined in this run; current implementation unknown. Reference: LC18; master line 1785.

Master work or verification: Resolve current authorized recipient at send; do not assign ownership as side effect.

Expected check: Remove creator access before trigger: no email to creator; authorized fallback only.

Dependency or boundary: ID/REQ

After a batch, optionally offer uploaded-list review for reminders.

Evidence: Examined gap or blocker remains in the supplied evidence. Reference: SO17; master line 581.

Examined ledger finding: need SO19 storage. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: P2 plus notification owner: optional batch-level reminder list.

Expected check: Upload multiple files; one optional review offer appears after batch.

Dependency or boundary: No reminder list found; not mandatory per-file prompts.

Reminder flow has Not now, later return and no navigation block.

Evidence: Examined gap or blocker remains in the supplied evidence. Reference: SO18; master line 582.

Examined ledger finding: need SO19 storage. Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: P2: nonblocking dismiss/reentry on new reminder list.

Expected check: Not now leaves page freely; later editing retains uploaded list.

Dependency or boundary: Do not reuse deadline auto-enrollment policy.

Document reminder dates/intervals are user chosen.

Evidence: Examined gap or blocker remains in the supplied evidence. Reference: SO19; master line 583.

Examined ledger finding: review date per document: Loom vault column or One API table (migration). Reconcile against the current implementation before treating this older finding as a new build task.

Master work or verification: P2/notifications: persist selected review dates only.

Expected check: Different documents receive chosen dates; no arbitrary annual reminders created.

Dependency or boundary: Six months/year/two years were examples, not defaults.

Automatically enroll an application in deadline reminders on Pursue.

Evidence: Not examined in this run; current implementation unknown. Reference: UXN005; master line 2343.

Master work or verification: Pursue transaction/event leads to reminder enrollment once; no drafting implied.

Default reminder one calendar month before funder deadline.

Evidence: Not examined in this run; current implementation unknown. Reference: UXN006; master line 2344.

Master work or verification: Month-boundary/leap-year fixture; never substitute fixed 30 days; timezone/precision rule explicit.

Default reminder two weeks before deadline.

Evidence: Not examined in this run; current implementation unknown. Reference: UXN007; master line 2345.

Master work or verification: Fourteen-day default fixture within date precision policy.

Default reminder one week before deadline.

Evidence: Not examined in this run; current implementation unknown. Reference: UXN008; master line 2346.

Master work or verification: Seven-day default fixture.

Default reminder two days before deadline.

Evidence: Not examined in this run; current implementation unknown. Reference: UXN009; master line 2347.

Master work or verification: Two-day default fixture.

Users adjust reminder timing and frequency in Settings.

Evidence: Not examined in this run; current implementation unknown. Reference: UXN010; master line 2348.

Master work or verification: Persist changed schedule; show current plan; deduplicate obsolete/new schedule versions.

Archive suspends application deadline reminders until explicit Resume.

Evidence: Not examined in this run; current implementation unknown. Reference: UXN011; master line 2349.

Master work or verification: Archive just before trigger produces no reminder; Resume reenables eligible future reminders.

Late Pursue/Resume missed-trigger catch-up remains an explicit open policy.

Evidence: Not examined in this run; current implementation unknown. Reference: UXN012; master line 2350.

Master work or verification: Ask only bounded catch-up policy before implementing immediate send/skip/batch/backfill; do not assume.

Unassigned application deadline/action-needed emails go to creator.

Evidence: Not examined in this run; current implementation unknown. Reference: UXN013; master line 2351.

Master work or verification: Unassigned fixture resolves creator without auto-assigning ownership.

If creator loses access, use authorized organization admin fallback.

Evidence: Not examined in this run; current implementation unknown. Reference: UXN014; master line 2352.

Master work or verification: Revoke creator before send; select authorized fallback and retain attribution; exact multiple-admin rule still matrix detail.

Do not email revoked creator or other unauthorized recipient.

Evidence: Not examined in this run; current implementation unknown. Reference: UXN015; master line 2353.

Master work or verification: Send-time access recheck, including queued notifications and contractors.

Recipient fallback must not assign application ownership.

Evidence: Not examined in this run; current implementation unknown. Reference: UXN016; master line 2354.

Master work or verification: Assert owner record unchanged after fallback delivery.

Changed deadlines reschedule reminders without invented time precision or duplicate sends.

Evidence: Not examined in this run; current implementation unknown. Reference: UXN026; master line 2364.

Master work or verification: Date revision fixture, old job fencing and correct current deadline display.

Document-review reminders remain optional, chosen after batch, with Not now/later and no navigation block.

Evidence: Not examined in this run; current implementation unknown. Reference: UXN027; master line 2365.

Master work or verification: After-batch list prompt, decline/later path and user-selected date; no blanket yearly expiry.

Document-reminder policy is not conflated with automatic application deadline reminders.

Evidence: Not examined in this run; current implementation unknown. Reference: UXN028; master line 2366.

Master work or verification: Separate enrollment/preferences/types; archive application does not silently rewrite document policy.

Receive meaningful change notifications

Traceability group F18; capability.

Scope connection: Delivery, deduplication, preferences and security-mail boundary are part of notifications. Durable in-app inbox and optional email/preferences deliver one notification capability. Channels, access checks and send-state variants are not separate features; event/recipient details may remain open.

Evidence in this group: 21 unexamined in this run.

Meaningful new matches or deadline/eligibility/active-app changes notify, not each refresh. W Q48; G S04/S22.

Evidence: Not examined in this run; current implementation unknown. Reference: NT011; master line 1150.

Master work or verification: Material-change events with watched/affected scopes, not refresh-success spam.

Expected check: Identical refresh quiet; consequential change produces one scoped notice.

Notification dedup/coalescing preserves event history and does not mean user has read it. F §2C; G S22.

Evidence: Not examined in this run; current implementation unknown. Reference: NT012; master line 1151.

Master work or verification: Add durable event and delivery/read receipts.

Expected check: Repeated source mentions one notice; accepted/delivered/read states remain distinct.

Failed delivery is retryable and visible; email failure does not fail application. F §2C; G S22.

Evidence: Not examined in this run; current implementation unknown. Reference: NT013; master line 1152.

Master work or verification: Configure verified mail route and retry receipts without coupling app transaction to mail.

Expected check: Mail outage leaves app saved and notification retryable, no false delivered status.

Optional-email opt-out does not disable critical account-security mail; app reminder policy remains separate. G V17/S22.

Evidence: Not examined in this run; current implementation unknown. Reference: NT015; master line 1154.

Master work or verification: Reuse auth mail plumbing, configure sender and explicit security category.

Expected check: Security event still sends under optional opt-out, only to authorized destination.

Notification deep link opens same authorized application and truthful current state, without resuming archived work. G S09/S22/V28.

Evidence: Not examined in this run; current implementation unknown. Reference: NT016; master line 1155.

Master work or verification: Link to current app identity with read-time authorization and state.

Expected check: Old reminder opened after archive is read-only; revoked user gets no private content.

Maintain durable in-app notifications/list.

Evidence: Not examined in this run; current implementation unknown. Reference: UXN001; master line 2339.

Master work or verification: Notification record and product entry/list, reload persistence and access tests.

Provide optional email notifications and personal preferences.

Evidence: Not examined in this run; current implementation unknown. Reference: UXN002; master line 2340.

Master work or verification: Preferences per user/category; configured authorized sender and end-to-end delivery proof.

Critical account-security emails remain enabled despite optional-email opt-out.

Evidence: Not examined in this run; current implementation unknown. Reference: UXN003; master line 2341.

Master work or verification: Role/removal/recovery/deletion security-event set and opt-out tests; exact remaining categories require matrix.

Make optional versus critical security email distinction visible in Settings.

Evidence: Not examined in this run; current implementation unknown. Reference: UXN004; master line 2342.

Master work or verification: Settings copy and behavior match nonoptional critical set.

Send-time access, not enrollment-time access alone, controls content/link recipients.

Evidence: Not examined in this run; current implementation unknown. Reference: UXN017; master line 2355.

Master work or verification: Revocation/role reduction between event and send; links reauthenticate.

Email carries minimal context and authenticated links rather than private content.

Evidence: Not examined in this run; current implementation unknown. Reference: UXN018; master line 2356.

Master work or verification: Payload review on notification matrix; authorized link destination and redaction fixtures.

Deduplicate by tenant/subscription/entity/material-change identity.

Evidence: Not examined in this run; current implementation unknown. Reference: UXN019; master line 2357.

Master work or verification: Replay/reordered/duplicate event fixture yields one intended notice and complete history.

Coalesce repeated identical source mentions without losing event history.

Evidence: Not examined in this run; current implementation unknown. Reference: UXN020; master line 2358.

Master work or verification: Multiple sources reporting same change do not produce spam; underlying history retained.

Notify on meaningful new match/deadline/eligibility/active-application changes, not every refresh.

Evidence: Not examined in this run; current implementation unknown. Reference: UXN021; master line 2359.

Master work or verification: Scheduled-refresh fixtures with unchanged/meaningful inputs; no automatic Pursue.

Watched-record access/requirements/cancellation/conflicting-evidence changes are visible notification events.

Evidence: Not examined in this run; current implementation unknown. Reference: UXN022; master line 2360.

Master work or verification: Event-to-authorized-recipient matrix plus each seeded event and revision link.

Accepted, delivered and read notifications are separate states.

Evidence: Not examined in this run; current implementation unknown. Reference: UXN023; master line 2361.

Master work or verification: Transport accept/failure/read receipts do not overclaim user awareness.

Failed delivery is visible/retryable and does not fail an application/run.

Evidence: Not examined in this run; current implementation unknown. Reference: UXN024; master line 2362.

Master work or verification: Mail/provider outage fixture preserves application state and retries safely.

Opening a notice leads to the correct authorized affected work.

Evidence: Not examined in this run; current implementation unknown. Reference: UXN025; master line 2363.

Master work or verification: Deep links/re-auth/current access and missing/deleted target tests.

Remaining event/category/assigned-owner recipient details stay explicit matrix decisions.

Evidence: Not examined in this run; current implementation unknown. Reference: UXN029; master line 2367.

Master work or verification: Close only unresolved behavior; do not reopen V17/V26/V27/V30.

No automatic funder outreach is introduced through notifications.

Evidence: Not examined in this run; current implementation unknown. Reference: UXN030; master line 2368.

Master work or verification: Inspect bounded outbound routes and regression-test no unauthorized funder communication. Absence of external submission does not establish absence of outreach. Drafting, sending and sharing feedback replies require separate authority.

Configure and demonstrate the production mail sender for email links, critical security messages and notifications.

Evidence: Not examined in this run; current implementation unknown. Reference: UXN031; master line 2370.

Master work or verification: 27 October observation has no sender; verify current configuration without secrets, then authorized delivery/bounce/retry tests. Google/Microsoft site sign-in is distinct and already available.

Interrupt and resume drafting safely

Traceability group F52; capability.

Scope connection: One durable run-control capability including cancellation, explicit resume and archive stop/read-only behavior; acceptance, checkpoint and honesty rules are safeguards within it. One job-control capability includes truthful progress, partial output, durable recovery and explicit cancel/resume. Checkpoint/fencing details are not separate features.

Evidence in this group: 17 unexamined in this run.

Worker completion/proposal is not human acceptance. D7B; PG S12

Evidence: Not examined in this run; current implementation unknown. Reference: RX01; master line 1616.

Master work or verification: Prove output stays proposal until authorized adoption

Expected check: finished job changes no accepted text

Dependency or boundary: RUN/DOC/ID

Accepted application revision, audit and outbox commit consistently; cross-store split accepts reconcile. D7B/17

Evidence: Not examined in this run; current implementation unknown. Reference: RX02; master line 1617.

Master work or verification: Kill/fail between stores and reconcile without duplicate/lost acceptance

Expected check: split-commit T16/T21

Dependency or boundary: DOC/RUN

Late stale run output is retained as proposal, never overwrites human text. D7B

Evidence: Not examined in this run; current implementation unknown. Reference: RX03; master line 1618.

Master work or verification: Use valid fence/revision at final effect

Expected check: late output after manual edit

Dependency or boundary: RUN/DOC

Useful completed work, inputs and operational checkpoint survive interruption. D7; PG S12/V24

Evidence: Not examined in this run; current implementation unknown. Reference: RX04; master line 1619.

Master work or verification: Trace actual checkpoint/acknowledged text loss boundary

Expected check: failure/restart exact-output comparison

Dependency or boundary: RUN/DOC

Cancel/resume is reachable and resume is explicit with current rights/allowance. PG S12/V24

Evidence: Not examined in this run; current implementation unknown. Reference: RX05; master line 1620.

Master work or verification: Wire existing routes with current state and no auto-resume

Expected check: cancel/fail/reconnect PT11

Dependency or boundary: RUN/ID

Archived documents are retained read/download-only until explicit Resume. PG V28

Evidence: Not examined in this run; current implementation unknown. Reference: RX06; master line 1621.

Master work or verification: Fence mutation without blocking authorized retained access

Expected check: archive read/download does not restart

Dependency or boundary: DOC/OUT/ID

Archive durably saves task state then terminates queued/active work, settles in-flight effects. PG V24

Evidence: Not examined in this run; current implementation unknown. Reference: RX07; master line 1622.

Master work or verification: State transition plus stop/fence/settle; not permanently live paused thread

Expected check: checkpoint failure cannot show archived success

Dependency or boundary: RUN/DOC

Run/source/budget states never falsely show completed/saved/synced when unproved. D2C/7; PG §2.3

Evidence: Not examined in this run; current implementation unknown. Reference: RX08; master line 1623.

Master work or verification: Bind truthful UI to service/state receipts, not optimistic mock

Expected check: absent provider and partial-run fixture

Dependency or boundary: RUN/DOC

Persist work admission before dispatch so replica/thread death cannot lose admitted work.

Evidence: Not examined in this run; current implementation unknown. Reference: RUN-001; master line 1981.

Master work or verification: Persist admission in existing durable job owner, not broker-only state.

Expected check: Crash immediately before/after dispatch yields one recoverable admitted run.

Persist scope, input graph/versions, tool/model/prompt IDs, outputs, validation, pending questions and cost/reservation.

Evidence: Not examined in this run; current implementation unknown. Reference: RUN-002; master line 1982.

Master work or verification: Audit/add only missing fields; no private reasoning text.

Expected check: Restart reconstructs useful operational state and precise pending work.

Checkpoints do not require storing hidden model reasoning.

Evidence: Not examined in this run; current implementation unknown. Reference: RUN-003; master line 1983.

Master work or verification: Preserve this invariant in archive checkpoint changes.

Expected check: Stored checkpoints show operational state without private reasoning bodies.

Lease/fencing tokens prevent obsolete workers from committing late results over newer state.

Evidence: Not examined in this run; current implementation unknown. Reference: RUN-004; master line 1984.

Master work or verification: Check fences at accepted state and host effects, not only worker start.

Expected check: Lease loss/cancel/restart races preserve stale result as candidate, never accepted overwrite.

Reuse completed step outputs only if input versions, rights, purpose and method compatibility remain valid.

Evidence: Not examined in this run; current implementation unknown. Reference: RUN-005; master line 1985.

Master work or verification: Replan affected subgraph, preserve unrelated valid work.

Expected check: Changed requirement/source/ACL/model-method fixtures reuse only valid nodes.

Bound elapsed time, retries, search, tokens, concurrency and replanning.

Evidence: Not examined in this run; current implementation unknown. Reference: RUN-006; master line 1986.

Master work or verification: Add operation bounds using measured policy; no invented numeric ceilings.

Expected check: Hung dependency and repeated-plan corpus stops with recoverable state/cost.

User can cancel running work through the product and cancellation stops future dispatch/adoption.

Evidence: Not examined in this run; current implementation unknown. Reference: RUN-007; master line 1987.

Master work or verification: Connect existing route with current permission and fence receipt.

Expected check: User cancel across queued/running/in-flight states yields accurate final status.

User can explicitly resume a paused/recoverable run through the product.

Evidence: Not examined in this run; current implementation unknown. Reference: RUN-008; master line 1988.

Master work or verification: Connect UI and current validation; no auto-resume.

Expected check: Valid checkpoint resumes required work once with durable visible receipt.

User sees honest queued/running/waiting/paused/partial/failed/cancelled state and usable partial outputs.

Evidence: Not examined in this run; current implementation unknown. Reference: RUN-012; master line 1992.

Master work or verification: Map real durable states, not optimistic thread completion.

Expected check: State/receipt UI tests across restart, dependency outage and partial success.

Control and inspect usage allowances

Traceability group F53; capability.

Scope connection: One administrator/customer spend-management capability: caps, usage states and controls. Atomic reservations, explicit resume, payer and open commercial units constrain it rather than adding features.

Evidence in this group: 20 unexamined in this run.

Enforce a hard organization/Centring ceiling customers cannot override.

Evidence: Not examined in this run; current implementation unknown. Reference: USE-001; master line 1956.

Master work or verification: Re-test new routes and concurrent all-channel dispatch; no launch blanket pass.

Expected check: Hard-cap adversarial tests across customer/admin/API/provider paths.

Reserve/check spend atomically before dispatch of drafter starts across replicas.

Evidence: Not examined in this run; current implementation unknown. Reference: USE-002; master line 1957.

Master work or verification: Preserve mechanism when modifying job admission.

Expected check: Current-release concurrent starts cannot over-authorize pool.

Atomic reservation also applies to One API's own paid route calls.

Evidence: Not examined in this run; current implementation unknown. Reference: USE-003; master line 1958.

Master work or verification: Reuse reservation owner for applicability, plan, Arachne, strengthen, guided, record and import calls.

Expected check: Concurrent route calls at cap, crash/retry and settlement tests with no overspend.

Settle actual usage and release only unused reservations.

Evidence: Not examined in this run; current implementation unknown. Reference: USE-004; master line 1959.

Master work or verification: Extend same semantics to route calls and new OCR/translation work.

Expected check: Partial failure, cancellation and duplicate receipt tests.

An uncertain/timeout provider outcome stays reserved or conservatively reconciled, never assumed free.

Evidence: Not examined in this run; current implementation unknown. Reference: USE-005; master line 1960.

Master work or verification: Track provider correlation/uncertain exposure and avoid blind replay.

Expected check: Timeout-before/after-provider-accept tests, settlement reconciliation and no double charging.

An already-issued noncancellable call may finish/settle inside authorized caps while future work stays stopped.

Evidence: Not examined in this run; current implementation unknown. Reference: USE-006; master line 1961.

Master work or verification: Fence output adoption and queue after archive/pause/revocation.

Expected check: Finish-in-flight with no later dispatch or archived restart.

Editing, accepted manual changes and authorized clean export remain available when allowance is exhausted.

Evidence: Not examined in this run; current implementation unknown. Reference: USE-007; master line 1962.

Master work or verification: Separate readiness/export restrictions from usage exhaustion.

Expected check: Exhaustion fixture permits manual work and authorized download without model call.

Renewal/unblocking never automatically resumes a paused run.

Evidence: Not examined in this run; current implementation unknown. Reference: USE-008; master line 1963.

Master work or verification: Encode rule explicitly when adding renewal and resume.

Expected check: Rollover/unblock/outage recovery yields no dispatch until explicit valid resume.

Resume revalidates current authorization, allowance, input/source versions and purpose.

Evidence: Not examined in this run; current implementation unknown. Reference: USE-009; master line 1964.

Master work or verification: Existing route must use same current gate as new work.

Expected check: Revoked/expired/source-withdrawn/cap-reduced resume tests.

Late usage settles to its original allowance period, not the new period.

Evidence: Not examined in this run; current implementation unknown. Reference: USE-010; master line 1965.

Master work or verification: Jacob's final period policy may require adapting the tested period boundary.

Expected check: Boundary receipt test under selected policy; no new-pool credit or duplicate settlement.

Display estimated cost/range separately from hard authorized maximum.

Evidence: Not examined in this run; current implementation unknown. Reference: USE-011; master line 1966.

Master work or verification: Estimate from measured costs, preserve ceiling as separate label.

Expected check: UI fixtures with distinct estimate/max and honest uncertainty.

Personal caps constrain access to shared allowance and are not secretly reserved private allocations.

Evidence: Not examined in this run; current implementation unknown. Reference: USE-012; master line 1967.

Master work or verification: Values/defaults owned by Jacob; mechanism can be built without inventing them.

Expected check: Concurrent users respect personal and organization limits without double-reserving pool.

Customer administrator can set allowed caps/additional use only within Centring ceiling.

Evidence: Not examined in this run; current implementation unknown. Reference: USE-013; master line 1968.

Master work or verification: Bounded admin capability; no paid top-up assumption.

Expected check: Customer lower/bounded cap allowed; hard-ceiling increase denied.

On cap cut/current-cycle block show running work and offer finish-current/block-new or safe-pause/block-new.

Evidence: Not examined in this run; current implementation unknown. Reference: USE-014; master line 1969.

Master work or verification: Implement both branches; issued calls settle; hard ceilings and access still apply.

Expected check: Mid-run cap-cut tests for each choice with durable checkpoint and preserved work.

Chargeable search/OCR/retries/model work must be included in its authorized operation budget.

Evidence: Not examined in this run; current implementation unknown. Reference: USE-015; master line 1970.

Master work or verification: Enumerate every paid caller and classify billing responsibility.

Expected check: Provider receipt reconciliation matches all charged work including failure/retry/OCR.

Routine sourcing/company operation is not silently charged to drafting allowance.

Evidence: Not examined in this run; current implementation unknown. Reference: USE-016; master line 1971.

Master work or verification: Resolve charge classification, not commercial price by inference.

Expected check: Routine recheck/search fixture leaves writing allowance untouched under selected policy.

Save, page view, review becoming stale and allowance renewal cannot silently initiate metered work.

Evidence: Not examined in this run; current implementation unknown. Reference: USE-017; master line 1972.

Master work or verification: Remove unintended dispatch triggers; preserve explicit operation controls.

Expected check: Navigation/save/stale/renewal test spy shows zero paid dispatch.

Restore cannot resurrect already-spent allowance or remove outstanding reservations.

Evidence: Not examined in this run; current implementation unknown. Reference: USE-018; master line 1973.

Master work or verification: Protected spend journal and reconciliation independent of app rollback.

Expected check: Restore older app snapshot after spend/cancellation; current pool and uncertain charges preserved.

User-facing unit, included amount, period/renewal, personal defaults and paid additional-use policy remain open with Jacob.

Evidence: Not examined in this run; current implementation unknown. Reference: USE-019; master line 1974.

Master work or verification: Do not invent subscription/top-up pricing or treat old budgets as authority.

Expected check: Jacob-selected policy recorded and reflected consistently in UI, meter and terms.

Cost/spend state distinguishes settled, reserved, exhausted, blocked, unavailable and renewable.

Evidence: Not examined in this run; current implementation unknown. Reference: USE-020; master line 1975.

Master work or verification: Expose actual ledger state without stale-counter authorization.

Expected check: State transition corpus and live ledger/UI reconciliation.

Platform security reliability and release acceptance

Respect selected topology, custody and provider boundaries

Traceability group S09; safeguard.

Scope connection: Deployment/custody choices and conditional technical mechanisms are not independent user features. Preserve data-class boundaries and actual selected architecture; do not convert open placement into approved work.

Evidence in this group: 32 unexamined in this run.

Establish actual current component/account/storage topology separately from intended placement.

Evidence: Not examined in this run; current implementation unknown. Reference: INF-001; master line 1853.

Master work or verification: Refresh current deployment inventory only with separate authorized evidence; retain code/config/observed distinctions.

Expected check: Dated component/account/data-flow inventory, deployment revision and clear observed-versus-proposed labels.

Resolve integrated backend/runtime placement without inferring it from private-document ownership.

Evidence: Not examined in this run; current implementation unknown. Reference: INF-002; master line 1854.

Master work or verification: Use B §C options and §E Q1-Q2 for explicit bounded user resolution; the follow-up has arrived but does not decide placement.

Expected check: Reconciled placement decision naming runtime, database, original documents, snapshots, inference and custody separately.

Do not make Centring a repository/archive of sensitive client documents merely because it runs inference.

Evidence: Not examined in this run; current implementation unknown. Reference: INF-003; master line 1855.

Master work or verification: Identify permissible storage versus transient handling; depends on INF-002 and route manifest.

Expected check: Actual storage inventory and request traces showing approved custody, explicit persistence and deletion behavior.

Preserve directly confirmed shared Foundry inference in Centring’s account without inferring backend placement.

Evidence: Not examined in this run; current implementation unknown. Reference: INF-004; master line 1856.

Master work or verification: Code in_tenant mode means client-compute mode, not an Office/Workspace install. Change its guard only if chosen placement requires it; preserve metering and caller authorization.

Expected check: Exact intended callers reach approved resource under tenant-aware authorization and metering; no unapproved fallback.

Treat Microsoft 365/Google Workspace identity/document tenancy as independent of cloud-runtime placement.

Evidence: Not examined in this run; current implementation unknown. Reference: INF-005; master line 1857.

Master work or verification: Distinguish office license/tenant, app registration, cloud compute and model subscription.

Expected check: Dependency matrix and deployment explanation supporting whichever profile is selected.

Do not claim Azure exclusivity, customer-subscription necessity or AWS/GCP launch support without selected deployment evidence.

Evidence: Not examined in this run; current implementation unknown. Reference: INF-006; master line 1858.

Master work or verification: Decide backend/custody first. Only customer backend/storage options raise customer-cloud profile questions.

Expected check: Explicit selected deployment scope with reproducible install, upgrade, restore and exit results for each advertised profile.

Keep gateway and credential mechanism conditional on selected topology and required security outcomes.

Evidence: Not examined in this run; current implementation unknown. Reference: INF-007; master line 1859.

Master work or verification: Derive minimal revocable, attributable, centrally bounded route after placement; do not add a service merely to satisfy stale D5.

Expected check: Approved route design with credential isolation, revocation, spend and logging tests.

Do not distribute an unrestricted shared Foundry key into customer-administered resources.

Evidence: Not examined in this run; current implementation unknown. Reference: INF-008; master line 1860.

Master work or verification: The current shared credential is reported fact; future customer placement cannot simply copy it.

Expected check: Per-caller/deployment revocation and quota proof without exposing cross-customer spending authority.

Do not retire or migrate existing production on stale assumptions about its users/data.

Evidence: Not examined in this run; current implementation unknown. Reference: INF-009; master line 1861.

Master work or verification: Current inventory and explicit decision needed; no retirement authorized.

Expected check: Dated production inventory, verified preservation plan and authorized migration/retirement decision.

Do not treat routine setup/updates as approval for standing infrastructure or content access.

Evidence: Not examined in this run; current implementation unknown. Reference: INF-010; master line 1862.

Master work or verification: Decide granted role, expiry and access renewal; sole-admin repair is separate.

Expected check: Approved operator-access model and tests proving excluded content/key/data-plane authority.

Company funds routine platform/infrastructure/model/data operation; customer placement does not silently transfer operating cost.

Evidence: Not examined in this run; current implementation unknown. Reference: INF-012; master line 1864.

Master work or verification: Separate operating payer from customer commercial allowance; Jacob policy stays open.

Expected check: Per-profile billing attribution/preflight and agreed funding arrangement; no surprise customer charge.

Maintain one route manifest containing sender, recipient, data class, purpose, account/resource/model, region, credentials, storage, logs, retention, access, terms, cost and failure handling.

Evidence: Not examined in this run; current implementation unknown. Reference: INF-013; master line 1865.

Master work or verification: Complete each route, including indirect downstream processors and provider copies.

Expected check: Versioned signed-off route inventory matched to config/runtime evidence.

Private credentials and private acquisition must not go to a public hub for ranking convenience.

Evidence: Not examined in this run; current implementation unknown. Reference: INF-014; master line 1866.

Master work or verification: Preserve private/public boundary when connecting existing sourcing components.

Expected check: Synthetic private markers absent from public hub, queues, search requests and shared logs.

Provider outage cannot trigger unapproved fallback or private-document transfer.

Evidence: Not examined in this run; current implementation unknown. Reference: INF-015; master line 1867.

Master work or verification: Still verify OCR, search, translation and connector fallback paths separately.

Expected check: Failure-injection route tests with denied fallback and retained usable work.

OCR, source translation, search and extraction each inherit explicit data-route approval; required translation does not authorize a new provider.

Evidence: Not examined in this run; current implementation unknown. Reference: INF-016; master line 1868.

Master work or verification: Route inventory and minimization for each capability; no silent route widening.

Expected check: Per-capability payload/recipient evidence, terms and negative fallback tests.

Optional resubmission comparison/reason sharing with Centring requires explicit opt-in and does not authorize package sharing or training.

Evidence: Not examined in this run; current implementation unknown. Reference: INF-017; master line 1869.

Master work or verification: Add purpose-specific selection and consent only with that bounded feature.

Expected check: Default-private test; selected fields only; separate withdrawal and no-training checks.

Reuse existing sound One API/Loom/Plinth components and reconcile physical owners before selecting new services.

Evidence: Not examined in this run; current implementation unknown. Reference: INF-018; master line 1870.

Master work or verification: Avoid independent replacement service/store per logical box.

Expected check: Concrete owner-to-existing-component map with one authoritative writer per accepted domain.

Resolve source-original, extracted/indexed text, drafts/answers/facts, checkpoints, submitted sets and logs as separate custody classes.

Evidence: Not examined in this run; current implementation unknown. Reference: INF-019; master line 1874.

Master work or verification: Decide permitted holder/purpose/retention for each class; do not call derived-only storage “no sensitive documents held.”

Expected check: Approved class-by-class route and persistence map, tested lifecycle/withdrawal/deletion matching it.

If source-reference custody is selected, prove source read/re-read, version/revocation and extraction without unintended original retention.

Evidence: Not examined in this run; current implementation unknown. Reference: INF-020; master line 1875.

Master work or verification: Implement only selected custody design, preserving source lineage and honest unavailable/revoked state.

Expected check: Reference-mode marker test proves permitted transient bytes, no disallowed original copy, version change/revocation handling and budgeted reprocessing.

Background provider access, if required, uses specifically consented per-organization credential persistence and revocation.

Evidence: Not examined in this run; current implementation unknown. Reference: INF-021; master line 1876.

Master work or verification: Establish which required jobs need unattended access; choose minimum scopes/secret storage; no inferred standing consent.

Expected check: Expiry/revocation/tenant-isolation tests; token rotation and deletion receipts; secrets absent from logs/export.

Preserve tenant isolation and no unauthorized Centring custody of sensitive documents; backend/private-storage placement must be reconciled.

Evidence: Not examined in this run; current implementation unknown. Reference: UXO001; master line 2398.

Master work or verification: Reconcile exact user evidence behind the recorded customer-owned app/private-storage baseline and the later author correction. Do not silently repeal the baseline or approve central custody; report topology options conditionally until resolved.

Separate office-suite identity/document services from runtime hosting choice.

Evidence: Not examined in this run; current implementation unknown. Reference: UXO002; master line 2399.

Master work or verification: Dependency map identifies runtime, identity, documents and inference independently.

Resolve backend placement/custody first, then provider constraints for any customer-hosted option.

Evidence: Not examined in this run; current implementation unknown. Reference: UXO003; master line 2400.

Master work or verification: A/B/C comparison with real dependencies; D3 withdrawn as standalone Azure decision. No customer subscription assumed under central option A.

Do not claim AWS/GCP supported until each advertised profile is certified.

Evidence: Not examined in this run; current implementation unknown. Reference: UXO004; master line 2401.

Master work or verification: Profile-specific test/capability report; provider table is proposal, not launch promise.

Maintain one product/configuration model rather than per-customer source forks, whichever deployment option is selected.

Evidence: Not examined in this run; current implementation unknown. Reference: UXO005; master line 2402.

Master work or verification: Reuse environment-driven app config; remove/parameterize pinned deployment values only if required by chosen option.

Version deployment identity, tenant, region/provider, app/schema/protocol/connector/policy.

Evidence: Not examined in this run; current implementation unknown. Reference: UXO006; master line 2403.

Master work or verification: Machine-readable actual deployment manifest and audit trail, no secrets in report.

If customer-hosted runtime selected, provide repeatable isolated infrastructure/deployment package.

Evidence: Not examined in this run; current implementation unknown. Reference: UXO007; master line 2404.

Master work or verification: Bounded absence: no customer deploy path/IaC reported. Not an unconditional launch blocker; central option reuses existing deployment and still needs operational safeguards.

Preflight actual selected runtime quotas/services/retention/consent/operating access and billing.

Evidence: Not examined in this run; current implementation unknown. Reference: UXO008; master line 2405.

Master work or verification: Selected-option preflight; do not require customer subscription/delegation for central backend candidate.

Preserve company-pays routine-operation requirement; agree funding arrangement if customer infrastructure chosen.

Evidence: Not examined in this run; current implementation unknown. Reference: UXO009; master line 2406.

Master work or verification: Document operating costs under selected option; reimbursement/managed account only if needed, never unilateral customer cost.

If customer infrastructure is selected, agree scoped Centring operating access; do not presume D6 applies to central hosting.

Evidence: Not examined in this run; current implementation unknown. Reference: UXO012; master line 2409.

Master work or verification: Compare authorized standing/time-bound rights only for chosen B/C needs; central A has no customer-runtime D6 grant.

Explicitly decide permitted custody of extracted text/index, drafts/accepted answers/facts and checkpoints, not only original files.

Evidence: Not examined in this run; current implementation unknown. Reference: UXO053; master line 2451.

Master work or verification: Data-class/recipient/retention decision for selected A/B/C option; central derived sensitive content is not “documents stay entirely in customer tenant.” Security worker owns detailed controls.

Keep user office-suite “in tenant,” code customer-compute mode, organizational isolation and cloud account separate.

Evidence: Not examined in this run; current implementation unknown. Reference: UXO054; master line 2452.

Master work or verification: Correct terminology in architecture/build contracts; never derive customer-Azure need from in_tenant flag alone.

Preserve authoritative records and safe operations

Traceability group S10; safeguard.

Scope connection: Stable identity, revision/idempotency/atomicity, truthful save state and deterministic human authority govern all capabilities. Existing post-award ownership is retained without adding the deferred full workspace.

Evidence in this group: 21 unexamined in this run.

One accepted application identity must remain stable across Home, list, sourcing, editor and export.

Evidence: Not examined in this run; current implementation unknown. Reference: API-001; master line 1882.

Master work or verification: External editor/export bindings and attempt/cycle distinctions remain separate work.

Expected check: Cross-entry-point identity test including each host and export manifest.

Keep one authority for accepted records; caches/search/read projections cannot become competing truth.

Evidence: Not examined in this run; current implementation unknown. Reference: API-002; master line 1883.

Master work or verification: Reconcile fact/record write ownership without a parallel store.

Expected check: Ownership registry, single-write tests and rebuildable projection proof.

Derive tenant/actor/service/purpose from authenticated context, never caller-supplied tenant ID.

Evidence: Not examined in this run; current implementation unknown. Reference: API-003; master line 1884.

Master work or verification: Validate nested IDs and all new routes, workers, exports and host adapters.

Expected check: Generated positive/negative route corpus with hostile body IDs and worker replay.

Stable object IDs, owner/scope, immutable revision, actor/time, provenance/classification and policy reference survive persistence and handoff.

Evidence: Not examined in this run; current implementation unknown. Reference: API-004; master line 1885.

Master work or verification: Add only missing required fields and propagation, not wholesale re-schema.

Expected check: Schema/round-trip fixtures for representative object and event types.

Namespaced external IDs and tenant-scoped foreign keys must not resolve another tenant's private object.

Evidence: Not examined in this run; current implementation unknown. Reference: API-005; master line 1886.

Master work or verification: Extend current test coverage to relationship joins and all surfaces.

Expected check: Foreign-ID reads/writes/counts/exports denied without existence leakage.

Mutations carry expected revision and return an authorized conflict without discarding the client candidate.

Evidence: Not examined in this run; current implementation unknown. Reference: API-006; master line 1887.

Master work or verification: Cover unguarded match decisions, grants and newly connected writes.

Expected check: Concurrent mutation corpus preserving both candidates and authorized conflict detail.

Idempotency key + identical content returns prior result; reused key + different content conflicts.

Evidence: Not examined in this run; current implementation unknown. Reference: API-007; master line 1888.

Master work or verification: Implement in existing mutation owner; not equivalent to only duplicate Pursue locking.

Expected check: Retry/time-out/different-payload tests and stable durable receipts.

Accepted state, audit and event outbox commit atomically.

Evidence: Not examined in this run; current implementation unknown. Reference: API-008; master line 1889.

Master work or verification: Correct counted-before-commit path; map other cross-component effects.

Expected check: Crash at every transaction boundary never records acceptance/event without accepted state.

Event envelopes identify schema/event/aggregate revisions, actor, occurrence/recording times, causation/correlation, hash and classification.

Evidence: Not examined in this run; current implementation unknown. Reference: API-009; master line 1890.

Master work or verification: Freeze compatible event contracts only for required integrations.

Expected check: Versioned reference schema and round-trip validated event fixtures.

Consumers deduplicate and acknowledge only durable application; missing parents/reordered events reconcile visibly.

Evidence: Not examined in this run; current implementation unknown. Reference: API-010; master line 1891.

Master work or verification: Integrate durable inbox/watermark/repair, preserving private overlays.

Expected check: Duplicate/reorder/drop/expired-cursor/crash replay tests with stable state.

Unknown major contract versions enter explicit incompatibility handling instead of silent application.

Evidence: Not examined in this run; current implementation unknown. Reference: API-011; master line 1892.

Master work or verification: Publish supported app/schema/protocol ranges.

Expected check: Mixed-version deployment tests and visible affected-function degradation.

Structured errors distinguish stale revision/binding, revoked permission, disallowed purpose, exhausted budget, partial external effect and reconciliation required.

Evidence: Not examined in this run; current implementation unknown. Reference: API-012; master line 1893.

Master work or verification: Reuse existing error handling; remove false saved/completed states.

Expected check: Error/receipt fixtures prove retry rules and no private error leakage.

Approval/send/sign/submit/access grants and financial commitment adoption remain deterministic authorized actions, never model/tool discretion.

Evidence: Not examined in this run; current implementation unknown. Reference: API-014; master line 1895.

Master work or verification: Preserve action boundaries when connecting helpers and agents.

Expected check: Adversarial source/model-output tests cannot execute privileged actions.

Preserve existing post-award One API obligations/reports ownership without adding the deferred full post-award workspace.

Evidence: Not examined in this run; current implementation unknown. Reference: API-015; master line 1896.

Master work or verification: No new post-award implementation inferred from original broader specification.

Expected check: Release scope shows preserved existing owner and no newly introduced conflicting authority.

Failed actions preserve entered text and selection where policy permits.

Evidence: Not examined in this run; current implementation unknown. Reference: UX018; master line 2275.

Master work or verification: Save/support failure and navigation fixtures prove no accepted or pending text lost.

Error references are safe correlation identifiers, not raw private or technical content.

Evidence: Not examined in this run; current implementation unknown. Reference: UX019; master line 2276.

Master work or verification: Rendered error and ticket payload review; strip private notes/raw payloads.

Distinguish unsaved, saving, saved, failed and conflicting changes.

Evidence: Not examined in this run; current implementation unknown. Reference: UX022; master line 2279.

Master work or verification: Persisted save receipts plus explicit failed/conflict status; no transient toast-only evidence.

Only durable persistence earns Saved; host-saved does not mean Beedy-synchronized.

Evidence: Not examined in this run; current implementation unknown. Reference: UX023; master line 2280.

Master work or verification: Controlled interruption/read-back across native and host surfaces; label separate persistence states.

Consequential confirmations identify application, source/surface, selected scope and consequences.

Evidence: Not examined in this run; current implementation unknown. Reference: UX024; master line 2281.

Master work or verification: Inspect each confirmation and negative/mistarget fixture; domain sections cover underlying acts.

Batch previews identify included changes and remaining pending changes.

Evidence: Not examined in this run; current implementation unknown. Reference: UX025; master line 2282.

Master work or verification: Partial selection/adoption fixture lists exact accepted and still-pending scope.

Retries preserve operation identity and reconcile uncertain outcomes before replay.

Evidence: Not examined in this run; current implementation unknown. Reference: UX026; master line 2283.

Master work or verification: UI duplicate/timeout tests paired with durable receipt; shared idempotency reported absent.

Enforce tenant privacy and secure processing

Traceability group S11; safeguard.

Scope connection: Cross-tenant, source lineage, data-purpose, masking, encryption and untrusted-input controls are product-wide safeguards. Support diagnostic review is mapped to support.

Evidence in this group: 21 unexamined in this run.

Private rows, counts, excerpts and writes must not cross tenant boundaries.

Evidence: Not examined in this run; current implementation unknown. Reference: SEC-001; master line 1929.

Master work or verification: Close reuse store and extend body-ID/new-route tests.

Expected check: Zero unauthorized reads/counts/excerpts/write paths across complete synthetic corpus.

Shared question/answer reuse must be tenant/purpose scoped rather than carry another organization's words.

Evidence: Not examined in this run; current implementation unknown. Reference: SEC-002; master line 1930.

Master work or verification: Tenant-scope existing repository and explicit admission for permitted nonprivate material.

Expected check: Unique tenant markers/voice never retrieved by other tenants, including migration/backups.

Private retrieval indexes, embeddings, prompts and caches inherit tenant, purpose and access-version constraints.

Evidence: Not examined in this run; current implementation unknown. Reference: SEC-003; master line 1931.

Master work or verification: Inventory all stores; no assumption database RLS covers files/caches/vectors.

Expected check: Marker sweep, collision/reconstruction tests and revocation invalidation for every store.

Customer-data model training is excluded under the current stronger drafter policy.

Evidence: Not examined in this run; current implementation unknown. Reference: SEC-004; master line 1932.

Master work or verification: Preserve policy even if older funding wording says opt-in by default.

Expected check: No private-training feature/path; provider/service declarations matched to configured endpoints.

Permission for drafting, model processing, sending, sharing and improvement are independent.

Evidence: Not examined in this run; current implementation unknown. Reference: SEC-005; master line 1933.

Master work or verification: Explicit grant basis/recipient/data/purpose at admission and use.

Expected check: Positive/negative cross-purpose tests; ordinary draft consent cannot enable sharing/training.

Every derived artifact retains source lineage, audience, purpose, effective period, expiry and withdrawal state.

Evidence: Not examined in this run; current implementation unknown. Reference: SEC-006; master line 1934.

Master work or verification: Extend source version lineage through outputs/caches/evals.

Expected check: Deletion/withdrawal follows marker from original through all derivatives.

Recheck permission at both admission and use, not only when data is uploaded.

Evidence: Not examined in this run; current implementation unknown. Reference: SEC-007; master line 1935.

Master work or verification: Shared policy lookup at dispatch, retrieval, adoption and external write.

Expected check: Rights withdrawn after caching/admission block later use.

Host document sharing is not Beedy permission; check destination audience before private excerpt/write/export.

Evidence: Not examined in this run; current implementation unknown. Reference: SEC-008; master line 1936.

Master work or verification: Required Docs/Word adapters need audience reconciliation; unclear audience blocks affected disclosure.

Expected check: Restricted source into broader shared document refused or separately authorized.

Mandatory masking must be measured and fail closed if detector missing/failing.

Evidence: Not examined in this run; current implementation unknown. Reference: SEC-009; master line 1937.

Master work or verification: Enable/test required path and honest unavailable state; masking not proof of anonymity.

Expected check: Detector corpus incl failures, bypass attempts and residual sensitive content metrics.

Encrypt transport and stored content, including backups; protect and rotate keys.

Evidence: Not examined in this run; current implementation unknown. Reference: SEC-010; master line 1938.

Master work or verification: Verify actual resource/policy, not inferred from Azure product capability.

Expected check: Config export and recovery/rotation tests without secret disclosure.

Workload/service identity is scoped, short-lived where appropriate and auditable.

Evidence: Not examined in this run; current implementation unknown. Reference: SEC-011; master line 1939.

Master work or verification: Resolve per-route credentials without asserting a required new gateway.

Expected check: Credential scope, individual revocation, replay/expiry and operator audit results.

Source documents/HTML/PDF text are untrusted data and cannot issue privileged instructions.

Evidence: Not examined in this run; current implementation unknown. Reference: SEC-012; master line 1940.

Master work or verification: Retain schema-bound extraction and external deterministic policy.

Expected check: Malicious source corpus cannot send, grant, submit, leak secrets or change authorization.

Isolate browser/parser/conversion/OCR workers from application DB and cloud metadata endpoints.

Evidence: Not examined in this run; current implementation unknown. Reference: SEC-013; master line 1941.

Master work or verification: Verify actual worker boundary for chosen deployment.

Expected check: Controlled hostile-file/metadata access tests and documented denied networks.

Egress controls validate destinations, redirects and resolved IPs; block private/link-local/loopback except approved connectors.

Evidence: Not examined in this run; current implementation unknown. Reference: SEC-014; master line 1942.

Master work or verification: Apply to supplied URL intake and acquisition, preserving approved private connector exceptions.

Expected check: SSRF/redirect/DNS-rebinding corpus denied; safe allowed targets still usable.

Enforce archive-bomb, file-size, execution-time and memory limits on untrusted ingestion.

Evidence: Not examined in this run; current implementation unknown. Reference: SEC-015; master line 1943.

Master work or verification: Add/reuse bounded ingestion policies.

Expected check: Oversized/recursive/corrupt fixtures terminate safely with honest user state.

Previews strip active content; downloads use safe content type and disposition.

Evidence: Not examined in this run; current implementation unknown. Reference: SEC-016; master line 1944.

Master work or verification: Review actual preview/render/download path.

Expected check: Script-bearing samples cannot execute and retained originals download safely.

Secrets stay in managed secret storage/references and never appear in exports, evidence, logs or support payloads.

Evidence: Not examined in this run; current implementation unknown. Reference: SEC-017; master line 1945.

Master work or verification: Inventory secret consumers and redaction/export filters.

Expected check: Seeded dummy-secret sweep of logs, exports, diagnostics and error receipts.

Sensitive staffing/finance sources use restricted access and minimal aggregates with inherited derived controls.

Evidence: Not examined in this run; current implementation unknown. Reference: SEC-018; master line 1946.

Master work or verification: Bound domain grants; avoid inventing role titles.

Expected check: Finance restricted-source fixtures across draft, review, host and export.

Shared improvement uses only permitted public/synthetic or separately admitted material, with reconstructability and voice-leak tests.

Evidence: Not examined in this run; current implementation unknown. Reference: SEC-019; master line 1947.

Master work or verification: No optional shared learning dependency for basic discovery or drafting.

Expected check: Admission records plus held-out reconstruction/voice-leak negative tests.

Default logs exclude document bodies/raw prompts; diagnostic content capture has explicit scope, retention and permission.

Evidence: Not examined in this run; current implementation unknown. Reference: SEC-020; master line 1948.

Master work or verification: Audit all logs and exact support payload rather than equating metadata with nonsensitive.

Expected check: Runtime marker sweep; no content in ordinary logs; approved diagnostic-only capture.

No zero-retention or client-only-processing claim without actual provider handling evidence.

Evidence: Not examined in this run; current implementation unknown. Reference: SEC-022; master line 1950.

Master work or verification: Obtain actual live settings/accepted terms and written clarification as needed.

Expected check: Route-specific retention/region/access evidence; honest documented residual provider copies.

Honor retention, deletion and legal holds

Traceability group S12; safeguard.

Scope connection: Per-class policy, health-data admission, holds and comprehensive truthful deletion govern capabilities. Open policy/contract evidence is not a standalone feature.

Evidence in this group: 8 unexamined in this run.

Adopt per-class retention policy distinguishing working/customer records, sealed records, licensed captures, ephemeral execution, logs, backups and approved improvement material.

Evidence: Not examined in this run; current implementation unknown. Reference: RET-001; master line 1998.

Master work or verification: Applicability/provider/counsel review before adopting periods.

Expected check: Approved class/trigger/owner/exception table mapped to configured stores/jobs.

Do not conflate deletion response deadlines with routine retention, backup expiry or mandatory retention.

Evidence: Not examined in this run; current implementation unknown. Reference: RET-002; master line 1999.

Master work or verification: California 90-day and Washington one-year examples are not approved durations.

Expected check: Legal/product review records separate categories and sources; no blanket number.

Establish applicable states/resident counts/data types and actual contract roles before selecting “strictest applicable.”

Evidence: Not examined in this run; current implementation unknown. Reference: RET-003; master line 2000.

Master work or verification: Bounded legal fact-gathering, not new architecture gate for ordinary synthetic tests.

Expected check: Qualified review tied to actual served populations, data categories and contracts.

Health/PHI/consumer-health-data admission policy must not be invented from general upload support.

Evidence: Not examined in this run; current implementation unknown. Reference: RET-004; master line 2001.

Master work or verification: Counsel/product decision before affected sensitive use.

Expected check: Explicit admission/exclusion/control policy and route/provider support evidence.

Implement holds so legitimate preservation obligations are not destroyed by routine deletion.

Evidence: Not examined in this run; current implementation unknown. Reference: RET-005; master line 2002.

Master work or verification: Select authorized hold scope/release rules and exceptions; not blanket indefinite retention.

Expected check: Hold blocks affected purge, logged release re-evaluates expiry; unrelated data unaffected.

Tracked deletion reaches bodies, quotes, facts, runs, captures, caches, vectors, logs, reusable answers, attachments and approved derivatives.

Evidence: Not examined in this run; current implementation unknown. Reference: RET-009; master line 2006.

Master work or verification: Complete inventory and deletion lineage; do not assume organization table deletion sufficient.

Expected check: Marker sweep across every named store, with justified retained exceptions only.

Deletion results record completed/retained/nonserving/expiry exceptions and never falsely claim universal erasure.

Evidence: Not examined in this run; current implementation unknown. Reference: RET-010; master line 2007.

Master work or verification: Make receipts reflect actual jobs and lawful hold/provider limits.

Expected check: Receipt reconciles every class and records unresolved exceptions transparently.

Immutability of submitted/decision history does not override lawful deletion duties.

Evidence: Not examined in this run; current implementation unknown. Reference: RET-011; master line 2008.

Master work or verification: Reconcile required preserved history, holds and lawful erasure with minimal tombstones.

Expected check: Authorized deletion fixture preserves only legally permitted minimal audit evidence.

Back up and restore the complete system safely

Traceability group S13; safeguard.

Scope connection: Backup/recovery across stores is a cross-cutting safeguard; proposed recovery targets/cadences remain unapproved. User recovery itself is mapped separately.

Evidence in this group: 18 unexamined in this run.

Back up metadata and every required document/source blob, not only the database.

Evidence: Not examined in this run; current implementation unknown. Reference: OPS-001; master line 2027.

Master work or verification: Inventory all stores and approved retention; host originals separate.

Expected check: Verified complete backup manifest with hashes and restoreable blobs.

Recovery manifest captures one known event/revision boundary across metadata, blobs, snapshots, approvals, submissions, jobs, usage and consent.

Evidence: Not examined in this run; current implementation unknown. Reference: OPS-002; master line 2028.

Master work or verification: Define consistent-cut/manifest implementation in existing owners.

Expected check: Cross-store restore at known cut passes references and required-blob checks.

Keep current deletion/access/consent/spend/external-effect journal outside application rollback boundary.

Evidence: Not examined in this run; current implementation unknown. Reference: OPS-003; master line 2029.

Master work or verification: Select minimal durable protection mechanism, no new service presumed.

Expected check: Old application restore still reads latest revocation/tombstone/spend watermark.

Restore into quarantine until current protection ledger and integrity are established.

Evidence: Not examined in this run; current implementation unknown. Reference: OPS-004; master line 2030.

Master work or verification: Apply current withdrawals/revocations/deletions before serving.

Expected check: Missing/stale journal leaves restored system nonserving; reconciled fixture can release.

Restore cannot resurrect withdrawn source use, deleted content, revoked access or spent allowance.

Evidence: Not examined in this run; current implementation unknown. Reference: OPS-005; master line 2031.

Master work or verification: Depends on OPS-002-004 and RET-009/USE-018.

Expected check: Plant markers, revoke/delete/spend, restore older snapshot; prohibited state never serves.

Restore reconciles irreversible provider/host effects before replay.

Evidence: Not examined in this run; current implementation unknown. Reference: OPS-006; master line 2032.

Master work or verification: Protected receipts and external readback.

Expected check: Crash/restore after uncertain apply/call never duplicates write, submission report or charge.

Rebuild search projections from authoritative retained records after restore.

Evidence: Not examined in this run; current implementation unknown. Reference: OPS-007; master line 2033.

Master work or verification: Index watermark distinct from accepted-state watermark.

Expected check: Reindex failure shows stale state; repaired projection agrees with authorized source of truth.

Selected RPO/RTO/cadence are measured on the chosen deployment before any customer promise.

Evidence: Not examined in this run; current implementation unknown. Reference: OPS-010; master line 2036.

Master work or verification: Numeric proposal is not approval; choose from measured cost/workload.

Expected check: Approved objectives and timed restore results including all in-scope stores.

Restore rehearsals cover actual cloud storage and main-console outage access, not just local file restore.

Evidence: Not examined in this run; current implementation unknown. Reference: OPS-011; master line 2037.

Master work or verification: Include controlled credentials/runbook access and restored application verification.

Expected check: Successful dated deployed-profile exercise with failures, timings and receipts.

Back up all required metadata, blobs, host references, approvals, run checkpoints and usage/access references.

Evidence: Not examined in this run; current implementation unknown. Reference: UXO027; master line 2424.

Master work or verification: Coordinated recovery manifest with hashes and known event boundary; database-only backup fails coverage.

Include drafter and API file shares in coordinated recovery.

Evidence: Not examined in this run; current implementation unknown. Reference: UXO028; master line 2425.

Master work or verification: Share backup evidence and restored blob/hash checks; reported no share backups.

Restore into quarantine until current permission/deletion/usage protection state reconciles.

Evidence: Not examined in this run; current implementation unknown. Reference: UXO029; master line 2426.

Master work or verification: Actual selected-profile drill with old backup, latest ledger, revoked rights, tombstones and settled-spend cases.

A recovery cannot restore withdrawn access/source use or previously spent allowance.

Evidence: Not examined in this run; current implementation unknown. Reference: UXO030; master line 2427.

Master work or verification: Negative protected-state rollback fixtures; security/usage section owns underlying journal.

Remain quarantined if current protection ledger/watermark cannot be established.

Evidence: Not examined in this run; current implementation unknown. Reference: UXO031; master line 2428.

Master work or verification: Missing/corrupt ledger fixture denies serving restored private state.

Demonstrate actual cloud restore rather than successful-backup status.

Evidence: Not examined in this run; current implementation unknown. Reference: UXO033; master line 2430.

Master work or verification: Selected deployment drill restores complete private state, reindexes public projections and records result.

Select measurable RPO/RTO; 15-minute/4-hour values are proposals only.

Evidence: Not examined in this run; current implementation unknown. Reference: UXO034; master line 2431.

Master work or verification: Owner-selected objectives then measured rehearsal; no numeric availability promise inferred.

Keep restore credentials/procedure available during main-console outage.

Evidence: Not examined in this run; current implementation unknown. Reference: UXO035; master line 2432.

Master work or verification: Outage access exercise with secure credential channel; do not expose secrets in evidence.

Rehearse after material storage change; quarterly cadence remains an original engineering proposal.

Evidence: Not examined in this run; current implementation unknown. Reference: UXO036; master line 2433.

Master work or verification: Adopt operating cadence and retain actual drill evidence; do not call proposed cadence current service.

Operate and deploy supported releases

Traceability group S14; safeguard.

Scope connection: Deployment, migration, telemetry, operator accountability and incident controls enable the product and do not add user-facing features. No offline or unproved release promise.

Evidence in this group: 34 unexamined in this run.

Company owns routine deployment, maintenance, source operations, backups and incident operation rather than requiring nonprofit operators.

Evidence: Not examined in this run; current implementation unknown. Reference: INF-011; master line 1863.

Master work or verification: Assign actual operating owners and execute bounded runbooks after authorization.

Expected check: Named accountable operators, tested runbooks, escalation and customer-independent routine operation.

Deployment/version manifest names release, schema/protocol/connector/policy, provider/region and compatibility window.

Evidence: Not examined in this run; current implementation unknown. Reference: OPS-012; master line 2038.

Master work or verification: Freeze repeatable release artifact, not floating main.

Expected check: Manifest matches actual deployed images/config and declared contracts.

Install from pinned/signed images and versioned infrastructure definitions, not floating dependencies or per-client forks.

Evidence: Not examined in this run; current implementation unknown. Reference: OPS-013; master line 2039.

Master work or verification: Map existing packaging and fill actual gaps.

Expected check: Reproducible digest/versioned package and signature verification evidence.

Preflight checks identity consent, capacity, services, retention, delegated access, funding and supported dependencies.

Evidence: Not examined in this run; current implementation unknown. Reference: OPS-014; master line 2040.

Master work or verification: Profile dependent; no assumption every customer needs Azure.

Expected check: Selected-profile failure/positive preflight corpus and capability report.

Database migrations preserve compatibility and are rehearsed on empty and representative copied databases.

Evidence: Not examined in this run; current implementation unknown. Reference: OPS-015; master line 2041.

Master work or verification: Release candidate and expand/contract or forward-fix/recovery plan.

Expected check: Empty/install and upgrade rehearsal including preserved IDs/permissions/history.

Binary rollback must not be claimed safe across destructive incompatible database migrations.

Evidence: Not examined in this run; current implementation unknown. Reference: OPS-016; master line 2042.

Master work or verification: Declare safe image/schema windows; restore/forward-fix where required.

Expected check: Rollback/forward-fix test preserves later decisions and protection journal.

Alerts have assigned owner, delivery status and actionable failure classification.

Evidence: Not examined in this run; current implementation unknown. Reference: OPS-017; master line 2043.

Master work or verification: Add minimal operational alerts and verify delivery; no unsupported support SLA.

Expected check: Inject storage/provider/queue/security incident, verify owner receives actionable alert.

Logs carry tenant-scoped correlation/operation/version/timing/token/cost/cache/retry/failure metadata without private bodies.

Evidence: Not examined in this run; current implementation unknown. Reference: OPS-018; master line 2044.

Master work or verification: Audit end-to-end propagation and selected retention.

Expected check: Single operation trace through API/workers/provider with no content/secret markers.

Incident response suspends affected credentials/jobs/sharing, preserves permitted forensic metadata and follows actual notification obligations.

Evidence: Not examined in this run; current implementation unknown. Reference: OPS-022; master line 2048.

Master work or verification: Review existing promises with legal/operations; do not invent SLA.

Expected check: Approved runbook plus rehearsal and notification capability consistent with terms.

Release acceptance proves zero cross-tenant leakage, no lost accepted text, no hard-cap overrun and no unauthorized auto-resume.

Evidence: Not examined in this run; current implementation unknown. Reference: OPS-023; master line 2049.

Master work or verification: Reuse tests, add missing scenarios, avoid counting test volume as end-to-end completion.

Expected check: Pinned release/fixtures/config and exact invariant results with failures resolved.

Baseline, production, showcase and open PR evidence remain distinct; local tests cannot certify live deployment.

Evidence: Not examined in this run; current implementation unknown. Reference: OPS-024; master line 2050.

Master work or verification: Preserve these labels in tracker and completion reporting.

Expected check: Each completion claim cites exact deployed revision/environment and matching test/run artifact.

No full offline Beedy promise or tamper-proof revocation of customer-administered infrastructure.

Evidence: Not examined in this run; current implementation unknown. Reference: OPS-025; master line 2051.

Master work or verification: Explain supported offline behavior only after selected topology/host proof.

Expected check: Offline rights/reconciliation matrix; no claims of erasing already-downloaded copies.

Routine operation after setup is tickets/updates, not customer IT labor.

Evidence: Not examined in this run; current implementation unknown. Reference: UXO011; master line 2408.

Master work or verification: Runbook and observed routine operation without per-grant staff or client infrastructure work.

Pin supported runtime/dependency versions; avoid floating latest tags.

Evidence: Not examined in this run; current implementation unknown. Reference: UXO013; master line 2410.

Master work or verification: Lockfiles, image digests and candidate manifest; portable containers and local runs do not establish all certified cloud profiles.

Verify artifact provenance for install; signed image/versioned infrastructure approach remains proposed mechanism.

Evidence: Not examined in this run; current implementation unknown. Reference: UXO014; master line 2411.

Master work or verification: Selected artifact-verification mechanism/log; AB reports no IaC, do not claim existing signed IaC deployment or mandate customer install.

Bootstrap identity/migrations/secrets, load catalog and test independent source access before production.

Evidence: Not examined in this run; current implementation unknown. Reference: UXO015; master line 2412.

Master work or verification: Clean deployment acceptance and original-source check; no secret values in deliverable.

Name release candidate and configuration; reconcile actual main/production/migration ancestry.

Evidence: Not examined in this run; current implementation unknown. Reference: UXO017; master line 2414.

Master work or verification: Current authorized read, inventory and candidate manifest; historical 18-gap count is not current verification.

Run required full gate on named candidate with skips/reruns explicitly recorded.

Evidence: Not examined in this run; current implementation unknown. Reference: UXO018; master line 2415.

Master work or verification: One attributable full candidate report, not 178 targeted tests or old gates alone.

Rehearse migrations on empty and copied representative databases.

Evidence: Not examined in this run; current implementation unknown. Reference: UXO019; master line 2416.

Master work or verification: Migration result with counts/hashes/statuses/actors/scope reconciliation and protected fixture data.

Inventory persistent-store upgrades including drafter SQLite.

Evidence: Not examined in this run; current implementation unknown. Reference: UXO020; master line 2417.

Master work or verification: Versioned upgrade/compatibility test; A explicitly leaves SQLite path uninspected.

Prefer compatible additive migrations and controlled expand/contract removal.

Evidence: Not examined in this run; current implementation unknown. Reference: UXO021; master line 2418.

Master work or verification: Compatibility-window proof and forward-fix/restore plan for irreversible steps.

Do not assume image rollback reverses destructive database migration.

Evidence: Not examined in this run; current implementation unknown. Reference: UXO022; master line 2419.

Master work or verification: Rollback procedure names compatible image/schema pairs and tested recovery/forward-fix.

Backfill known provenance while retaining unknown actor/status/history as unknown.

Evidence: Not examined in this run; current implementation unknown. Reference: UXO023; master line 2420.

Master work or verification: Fixture migration verifies unknowns not fabricated and old approval scope not enlarged.

Reconcile competing accepted-answer authorities before retiring old writers.

Evidence: Not examined in this run; current implementation unknown. Reference: UXO024; master line 2421.

Master work or verification: Divergence inventory, canonical revision/outbox reconciliation and approved retirement window.

Shadow comparison must not duplicate paid calls or dual authoritative writes.

Evidence: Not examined in this run; current implementation unknown. Reference: UXO025; master line 2422.

Master work or verification: Replay/shadow fixture proves no external paid dispatch or duplicate accepted effects.

Canary cutover fences obsolete sessions and preserves pending user edits.

Evidence: Not examined in this run; current implementation unknown. Reference: UXO026; master line 2423.

Master work or verification: Session and pending-edit fixtures plus bounded rollback on consented/synthetic canary.

Operational dashboards expose health/versions/job age/storage/sync and exclude raw private content.

Evidence: Not examined in this run; current implementation unknown. Reference: UXO044; master line 2441.

Master work or verification: Selected-profile telemetry manifest and field-level privacy review; alerting reported absent.

Carry correlation/tenant-operation IDs and versions through stages.

Evidence: Not examined in this run; current implementation unknown. Reference: UXO045; master line 2442.

Master work or verification: One end-to-end trace stitches requests/jobs/captures/entities/deployments without payload leaks.

Record stage durations/tokens/reservations/settled cost/cache/retries/failure categories.

Evidence: Not examined in this run; current implementation unknown. Reference: UXO046; master line 2443.

Master work or verification: Metric inventory and end-to-end trace; distinguish live measurement from code instrumentation.

Assign source/fact, engineering and platform-operating ownership.

Evidence: Not examined in this run; current implementation unknown. Reference: UXO047; master line 2444.

Master work or verification: Named roster/runbook, escalation and coverage; Graeme integration/acceptance settled, not every duty.

Critical deadline conflicts/coverage losses alert responsible operator, lower priority remains queued.

Evidence: Not examined in this run; current implementation unknown. Reference: UXO048; master line 2445.

Master work or verification: Seed incidents demonstrate routing, severity, delivery receipts and noncritical queue.

Never tell user operator notified without successful delivery.

Evidence: Not examined in this run; current implementation unknown. Reference: UXO049; master line 2446.

Master work or verification: Alert-send failure/ack test and customer status text aligned with actual receipt.

Incident response has tested containment, impact assessment and permitted forensic metadata.

Evidence: Not examined in this run; current implementation unknown. Reference: UXO050; master line 2447.

Master work or verification: Rehearsal with authorized credential/job/sharing containment; legal obligations owned by security section.

Reconcile historic 72-hour breach-notice claim with effective legal/operational coverage.

Evidence: Not examined in this run; current implementation unknown. Reference: UXO051; master line 2448.

Master work or verification: Legal/security review and actual response runbook; no certification claimed.

Keep permitted work usable through outages

Traceability group S15; safeguard.

Scope connection: Outage/manual-work/partial-export behaviors are failure-path variants of existing capabilities, not new features.

Evidence in this group: 9 unexamined in this run.

Source/hub outage preserves permitted last-good facts with honest freshness and private work.

Evidence: Not examined in this run; current implementation unknown. Reference: OPS-019; master line 2045.

Master work or verification: Connect failure state without declaring stale corpus current.

Expected check: Hub/source outage test preserves read/private work and displays last-good/failure state.

Model outage preserves drafts/evidence and allows manual/deterministic work.

Evidence: Not examined in this run; current implementation unknown. Reference: OPS-020; master line 2046.

Master work or verification: No unapproved provider fallback; accurate paused/failed model status.

Expected check: Model-off test completes permitted manual edit/check/export with honest capability state.

Notification failure must not corrupt application/run state or imply delivered/read.

Evidence: Not examined in this run; current implementation unknown. Reference: OPS-021; master line 2047.

Master work or verification: Delivery receipts/retry semantic dedup; notification UI owned elsewhere.

Expected check: Failed/uncertain send preserves application and records retryable delivery only.

Hub/source outage preserves last-good facts/context with honest freshness.

Evidence: Not examined in this run; current implementation unknown. Reference: UXO037; master line 2434.

Master work or verification: Hub-down fixture, last applied position, browse/private work and allowed integration paths.

Hub recovery replays eligible queued contributions without silent loss.

Evidence: Not examined in this run; current implementation unknown. Reference: UXO038; master line 2435.

Master work or verification: Outage/replay fixture paired with discovery sync section; no private sharing beyond permissions.

Model outage leaves manual work and deterministic checks available with truthful state.

Evidence: Not examined in this run; current implementation unknown. Reference: UXO039; master line 2436.

Master work or verification: No-drafter fixture removes false Start/cost offer and preserves edit/check/export paths.

Allowance exhaustion preserves permitted manual work and requires explicit run resume later.

Evidence: Not examined in this run; current implementation unknown. Reference: UXO041; master line 2438.

Master work or verification: UX fixtures paired with usage gate; actual clean export must exist to claim preserved export.

Partial export reports gaps, preserves verified pieces and reconciles uncertain retry.

Evidence: Not examined in this run; current implementation unknown. Reference: UXO042; master line 2439.

Master work or verification: Fault-injected manifest export; editor/export workstream owns renderer.

Do not promise a fully offline Beedy product.

Evidence: Not examined in this run; current implementation unknown. Reference: UXO043; master line 2440.

Master work or verification: Support/capability copy distinguishes local catalog lease, host offline text and unavailable cloud AI.

Prove release quality and govern delivery

Traceability group S17; safeguard.

Scope connection: Evaluation, independent customer completion, release evidence, tracker/process and scope controls are acceptance/delivery requirements. They add no customer feature and imply no completion date.

Evidence in this group: 44 unexamined in this run.

Rapidly connect complete MVP and integrate continuously, then comprehensive pre-ship hardening.

Evidence: Not examined in this run; current implementation unknown. Reference: UXR001; master line 2458.

Master work or verification: Tracker orders connected slices and final finite hardening; no per-component perfection or silent safeguard removal.

Retain existing tests, focused regression checks and critical access/data/billing safeguards while building.

Evidence: Not examined in this run; current implementation unknown. Reference: UXR002; master line 2459.

Master work or verification: Candidate workflow runs required checks despite historical CI-off state; monitor skips/reruns.

Do not turn minor polish or open-ended bug hunts into endless slice blockers.

Evidence: Not examined in this run; current implementation unknown. Reference: UXR003; master line 2460.

Master work or verification: Classify bugs by required invariant/journey versus bounded polish; escalate consequential cycling.

One complete path covers questions, evidence, budget, review, export and interruptions, not generation alone.

Evidence: Not examined in this run; current implementation unknown. Reference: UXR004; master line 2461.

Master work or verification: Recorded end-to-end fixtures on candidate with external human-submission handoff.

All three required editors satisfy their declared launch path.

Evidence: Not examined in this run; current implementation unknown. Reference: UXR005; master line 2462.

Master work or verification: Native/Docs/Word host evidence; exports alone do not satisfy integrations.

Map product PT01-21, discovery AT01-32 and integration IT01-47 to reused tests without competing suites.

Evidence: Not examined in this run; current implementation unknown. Reference: UXR006; master line 2463.

Master work or verification: Stable requirement-to-test-to-evidence register, with unresolved and not-applicable reasons.

Freeze candidate, configuration, inputs, source versions and development/held-out fixtures.

Evidence: Not examined in this run; current implementation unknown. Reference: UXR007; master line 2464.

Master work or verification: Versioned evaluation manifest; historical showcase cases are not frozen current held-out baseline.

Use synthetic or explicitly consented sanitized evaluation material.

Evidence: Not examined in this run; current implementation unknown. Reference: UXR008; master line 2465.

Master work or verification: Fixture provenance/consent record; fictional screenshots/live-model history do not authorize new private use.

Separately authorize paid live calls/integration sandboxes/recovery rehearsals.

Evidence: Not examined in this run; current implementation unknown. Reference: UXR009; master line 2466.

Master work or verification: Explicit execution authority/cost limits before later runs; current task remains report-only.

Compare pinned current baseline and target on same inputs/source versions/comparable budgets.

Evidence: Not examined in this run; current implementation unknown. Reference: UXR010; master line 2467.

Master work or verification: Scored current baseline/target report; A reports no scored live baseline since 20 Sep.

Preserve model/prompt/tool settings and repeat stochastic runs.

Evidence: Not examined in this run; current implementation unknown. Reference: UXR011; master line 2468.

Master work or verification: Reproducible manifest and repeated score/cost variance; select run counts rather than invent.

Independent qualified human rating/adjudication uses passages/calculations.

Evidence: Not examined in this run; current implementation unknown. Reference: UXR012; master line 2469.

Master work or verification: Selected raters/subset/blinding and disagreements recorded; two-rater/24-case numbers not silently mandatory.

Do not treat awards, user acceptance or model confidence as truth/quality labels.

Evidence: Not examined in this run; current implementation unknown. Reference: UXR013; master line 2470.

Master work or verification: Rubric separates external outcome, human preference and factual/evidentiary accuracy.

Measure support/coherence/coverage/causal restraint/finance/voice/editing burden.

Evidence: Not examined in this run; current implementation unknown. Reference: UXR014; master line 2471.

Master work or verification: Baseline comparison across applicable dimensions; draft_quality.py thresholds alone incomplete.

Representative corpus includes short/long, rubric/no rubric, portal gaps, conflicts, restricted staffing, growth/multiple grants/cash timing.

Evidence: Not examined in this run; current implementation unknown. Reference: UXR015; master line 2472.

Master work or verification: Coverage matrix and adversarial fixtures; amended-agreement fixture only if later scope approved.

Evaluate supported languages, organization sizes and input quality.

Evidence: Not examined in this run; current implementation unknown. Reference: UXR016; master line 2473.

Master work or verification: Declared strata and gaps; non-English-source translation not a multilingual UI promise.

PT21 demonstrates independent ongoing onboarding, discovery, drafting, review and human-submission preparation.

Evidence: Not examined in this run; current implementation unknown. Reference: UXR017; master line 2474.

Master work or verification: Observed sufficiently supplied normal case completes with in-product guidance/recovery after allowed setup.

PT21 permits initial assisted setup but not routine per-grant Centring help.

Evidence: Not examined in this run; current implementation unknown. Reference: UXR018; master line 2475.

Master work or verification: Record setup assistance separately from ongoing customer work; no forced no-call MVP criterion.

PT21 must not rely on staff authoring/substantive rewriting to rescue output.

Evidence: Not examined in this run; current implementation unknown. Reference: UXR019; master line 2476.

Master work or verification: Actor-authorship log and independent task observation with zero staff-authored rescue text.

Record concierge switch off during PT21; exception support does not count as product success.

Evidence: Not examined in this run; current implementation unknown. Reference: UXR020; master line 2477.

Master work or verification: Candidate configuration proof plus task log; keep/remove concierge remains separate unapproved proposal.

Select PT21 organization count and consented-real versus synthetic cases explicitly.

Evidence: Not examined in this run; current implementation unknown. Reference: UXR021; master line 2478.

Master work or verification: Freeze agreed count/material policy; no three-client threshold automatically adopted.

Finite release tests prove no critical cross-tenant access/count/excerpt leakage.

Evidence: Not examined in this run; current implementation unknown. Reference: UXR022; master line 2479.

Master work or verification: Foreign IDs in paths and bodies, second deployment and private-data boundaries; skip-free detector cases where required.

Finite concurrency/switch/offline corpus loses no acknowledged human text.

Evidence: Not examined in this run; current implementation unknown. Reference: UXR023; master line 2480.

Master work or verification: Integrate native CAS with host and offline corpus; no extrapolation from 121 native tests.

Finite spend corpus never exceeds approved hard ceilings, including route-level calls.

Evidence: Not examined in this run; current implementation unknown. Reference: UXR024; master line 2481.

Master work or verification: Concurrent all-paid-route tests and uncertain effects; detailed usage section owns fixes.

Export corpus removes prohibited comments/hidden/internal residue while retaining intentional/funder-required references.

Evidence: Not examined in this run; current implementation unknown. Reference: UXR025; master line 2482.

Master work or verification: Inspect actual exported files/manifests; A proposed ban on all “Sources” needs qualification, not deletion of required references.

No submission record without an attributable authorized person and explicit confirmation.

Evidence: Not examined in this run; current implementation unknown. Reference: UXR026; master line 2483.

Master work or verification: Submission section evidence across current scopes/upload/version choices; no external submit action.

Renewal never automatically resumes paused drafting.

Evidence: Not examined in this run; current implementation unknown. Reference: UXR027; master line 2484.

Master work or verification: Renewal/recovery fixtures establish explicit user choice, not merely no renewal implementation.

Run full required browser/accessibility/host journeys before release.

Evidence: Not examined in this run; current implementation unknown. Reference: UXR028; master line 2485.

Master work or verification: Recorded matrices and defects; 72 Chrome images are not comprehensive verification.

Measure latency/load/cost on chosen deployment profile, separating active machine time from human waits.

Evidence: Not examined in this run; current implementation unknown. Reference: UXR029; master line 2486.

Master work or verification: Reproducible profile p50/p95, first-useful output, throughput, retries, cancellation waste, cold-start and throttling measurements. Numeric targets remain proposals until selected.

Numeric save/page latency, availability, RPO/RTO and load values remain proposals until selected.

Evidence: Not examined in this run; current implementation unknown. Reference: UXR030; master line 2487.

Master work or verification: Explicit owner-selected targets; 2s/99.9%/15min/4h and example scale are not achieved promises.

Run actual alert/incident and migration/recovery rehearsal with named owner.

Evidence: Not examined in this run; current implementation unknown. Reference: UXR031; master line 2488.

Master work or verification: End-to-end drill receipts and selected loss bounds, not backups alone.

No unresolved critical security/data-loss/unauthorized-action defect or failed core invariant at release.

Evidence: Not examined in this run; current implementation unknown. Reference: UXR032; master line 2489.

Master work or verification: Release owner approves severity/threshold policy and reviews explicit failing test list; do not call all policy fixed.

Required supported-host journey blocker needs accepted safe usable workaround or repair before release claim.

Evidence: Not examined in this run; current implementation unknown. Reference: UXR033; master line 2490.

Master work or verification: Per-operation accepted workaround with demonstrated safety; no silent dropping Docs/Word/mobile.

Lower-impact residual defects require named owner and explicit release-owner acceptance.

Evidence: Not examined in this run; current implementation unknown. Reference: UXR034; master line 2491.

Master work or verification: Bounded residual register with impact, workaround, owner and acceptance.

Missing evidence is not a pass; finite zero failures is not universal correctness.

Evidence: Not examined in this run; current implementation unknown. Reference: UXR035; master line 2492.

Master work or verification: Summary states tested boundary, skips, limitations and unknowns; avoid completion percentages from broad row counts.

Version release manifest across code/prompts/models/retrieval/rules/adapters and retain rollback.

Evidence: Not examined in this run; current implementation unknown. Reference: UXR036; master line 2493.

Master work or verification: Exact candidate/config manifest, approved output/privacy contract, consented canary and rollback evidence.

Graeme owns integration and acceptance; other operating responsibilities/thresholds remain to select.

Evidence: Not examined in this run; current implementation unknown. Reference: UXR037; master line 2494.

Master work or verification: Acceptance signoff record identifies Graeme and specific named operational owners without fabricating delegation.

No delivery date or one-to-two-week promise before dependencies/staffing/test effort known.

Evidence: Not examined in this run; current implementation unknown. Reference: UXR038; master line 2495.

Master work or verification: Dependency estimate includes editor approvals/cloud access/hardening; do not silently cut scope to fit date.

One authoritative tracker has stable IDs, dependency links, completion tests, evidence and status.

Evidence: Not examined in this run; current implementation unknown. Reference: UXR039; master line 2496.

Master work or verification: Atomic register merged into one durable tracker; aggregate M-row count not a feature completion percentage.

Nightly priorities and approved overflow derive from that tracker, with what/how/not-to-do prompt.

Evidence: Not examined in this run; current implementation unknown. Reference: UXR040; master line 2497.

Master work or verification: Reviewable prompt/list generated from current tracker, no invented scope or automatic schedule.

Record blockers; continue only independent approved work; checkpoint after each task and resume durably after interruption.

Evidence: Not examined in this run; current implementation unknown. Reference: UXR041; master line 2498.

Master work or verification: Durable task journal/checkpoints and dependency status; exact authorization gates retained.

Use efficient reliable minimum-complexity implementation and classify discoveries instead of expanding scope.

Evidence: Not examined in this run; current implementation unknown. Reference: UXR042; master line 2499.

Master work or verification: Change/review evidence links each action to approved requirement or separate proposed enhancement.

Morning reports say completed, blocked and actionable; terminal monitoring dropped.

Evidence: Not examined in this run; current implementation unknown. Reference: UXR043; master line 2500.

Master work or verification: Report template links exact evidence and decisions; do not schedule/send reports without authority.

Beedy assessment remains code/app-access-free until separately authorized; user runs Claude checks.

Evidence: Not examined in this run; current implementation unknown. Reference: UXR044; master line 2501.

Master work or verification: This review obeyed the boundary using only supplied files; product implementation status is not applicable. Future closure requests are copyable bounded prompts, not assistant execution.

Scope boundaries and deferrals

Product and service scope boundaries

Traceability group B01; excluded.

Scope connection: Audience, exceptional services, scale constraints and exclusions are not additional launch software features. Deferred broad award reporting stays excluded.

Evidence in this group: 18 unexamined in this run; 1 deferred.

Primary launch persona is executive directors/C-suite nonprofit staff who are not grant writers, especially small/mid-sized nonprofits; experienced writers benefit but are secondary.

Evidence: Not examined in this run; current implementation unknown. Reference: WA01; master line 231.

Master work or verification: Name target users and size strata in PT21 fixtures; do not invent size thresholds or exclude larger organizations.

Expected check: Observe a non-grantwriter executive at small/mid-sized nonprofit completing normal flow; separately assess experienced-writer correction burden.

New/underprepared organizations may request readiness assessment and choose a separate paid, bounded incubator, potentially including scoped application writing, aimed at independent use; no automatic enrollment or free ongoing help.

Evidence: Not examined in this run; current implementation unknown. Reference: WA03; master line 233.

Master work or verification: Record optional service boundary and user choice; leave price/scope/duration unselected.

Expected check: New organization can remain self-service; choosing assessment does not enroll or charge; any incubator offer identifies separate scoped service.

Novice hypothetical-organization test should find suitable grant and prepare application same day, ideally around an hour; aspirational, not universal SLA or fictitious real submission.

Evidence: Not examined in this run; current implementation unknown. Reference: WA04; master line 234.

Master work or verification: Amend acceptance protocol with setup, human waits and full journey timing; do not create numerical pass threshold without decision.

Expected check: Record novice elapsed time, assistance and draft quality against same-day/~hour aspiration; synthetic case cannot submit to real funder.

Launch proof includes reliable use with current pilot group and comfortable self-service handoff; approximately 15 people is illustrative, not quota.

Evidence: Not examined in this run; current implementation unknown. Reference: WA05; master line 235.

Master work or verification: Include pilot evidence and handoff readiness alongside synthetic tests; select consent and sample details separately.

Expected check: Pilot usage/recovery record supports self-service without founder writing; no claim of pass solely from 15 participants.

One paid organization account/profile supports multiple users; one payment does not add additional organizations to the same profile.

Evidence: Not examined in this run; current implementation unknown. Reference: WA06; master line 236.

Master work or verification: Add explicit account/organization entitlement boundary without inventing price or blocking authorized users.

Expected check: Second organization cannot be silently added under one purchased profile; multiple authorized people can use same organization.

Outside grantwriters can be invited into organization account; separate consultant registration, portfolio, multi-organization switching and new consultant pricing are deferred.

Evidence: Not examined in this run; current implementation unknown. Reference: WA07; master line 237.

Master work or verification: Retain organization invitation workflow and collaborator controls; exclude independent consultant platform from launch gates.

Expected check: Invite outside writer with scoped rights; launch checklist does not require consultant portfolio or cross-client switcher.

For-profit corporate work is not automatically excluded; requires explicit Centring approval and client discussion before exceptional service.

Evidence: Not examined in this run; current implementation unknown. Reference: WA11; master line 241.

Master work or verification: Record bounded exception approval and customer discussion; extra support or separate product is case-dependent, not automatically required.

Expected check: Present category case: neither automatic blanket rejection nor routine unsupported acceptance; named Centring approval/discussion recorded before exception path.

Government procurement is not automatically excluded; requires explicit Centring approval and client discussion before exceptional service.

Evidence: Not examined in this run; current implementation unknown. Reference: WA12; master line 242.

Master work or verification: Record bounded exception approval and customer discussion; extra support or separate product is case-dependent, not automatically required.

Expected check: Present category case: neither automatic blanket rejection nor routine unsupported acceptance; named Centring approval/discussion recorded before exception path.

Defense work is not automatically excluded; requires explicit Centring approval and client discussion before exceptional service.

Evidence: Not examined in this run; current implementation unknown. Reference: WA13; master line 243.

Master work or verification: Record bounded exception approval and customer discussion; extra support or separate product is case-dependent, not automatically required.

Expected check: Present category case: neither automatic blanket rejection nor routine unsupported acceptance; named Centring approval/discussion recorded before exception path.

Individual applicants is not automatically excluded; requires explicit Centring approval and client discussion before exceptional service.

Evidence: Not examined in this run; current implementation unknown. Reference: WA14; master line 244.

Master work or verification: Record bounded exception approval and customer discussion; extra support or separate product is case-dependent, not automatically required.

Expected check: Present category case: neither automatic blanket rejection nor routine unsupported acceptance; named Centring approval/discussion recorded before exception path.

Capital-campaign support is writing only: excludes architecture, technical cost estimating, building-code compliance, technical sign-off and running campaign.

Evidence: Not examined in this run; current implementation unknown. Reference: WA20; master line 250.

Master work or verification: Add scope disclosure and safety routing; budget narrative may describe supplied estimates without certifying them.

Expected check: Request technical estimate/code approval/campaign operation: product does not claim or perform it; narrative assistance remains available.

No arbitrary total customer ceiling is desired; isolate customers so increasing customer count does not degrade others beyond declared capacity.

Evidence: Not examined in this run; current implementation unknown. Reference: WA22; master line 252.

Master work or verification: Retain isolation outcome and measured capacity admission; do not revive mandatory customer hosting or promise unlimited capacity.

Expected check: Multi-tenant load test on selected topology measures isolation; documented capacity limits justified by actual resources rather than invented policy.

No artificial total stock caps on active applications/documents; large collections should be organized/segmented. Fifty active applications is illustrative subject to infrastructure.

Evidence: Not examined in this run; current implementation unknown. Reference: WA23; master line 253.

Master work or verification: Distinguish storage/application inventory from paid execution allowances; test navigation at representative sizes.

Expected check: Representative large collection remains navigable without arbitrary entitlement cutoff; paid work still obeys approved hard ceilings.

Customer retains final review, actual submission, contracting and related commitments; AI assistance is not fully hands-off.

Evidence: Not examined in this run; current implementation unknown. Reference: WA24; master line 254.

Master work or verification: Add responsibility disclosure, retaining human commitment authorization; not contract-management scope or legal waiver.

Expected check: Customer-facing flow explains who reviews/submits/contracts; draft or approval never automatically enters contract.

No guarantee of award/application success; funder-controlled outcomes are not product-quality proof.

Evidence: Not examined in this run; current implementation unknown. Reference: WA25; master line 255.

Master work or verification: Review bounded product statements; keep exact legal/website copy and publication approval unresolved.

Expected check: Setup/product explanation does not guarantee award; measured drafting improvement is not represented as funding certainty.

Client meetings explain supported/unsupported behavior; future confidential roadmap is not authorized for publication.

Evidence: Not examined in this run; current implementation unknown. Reference: WA26; master line 256.

Master work or verification: Add setup disclosure checklist and public-claims approval check; placement/exact text remains open.

Expected check: Reviewed meeting material explains boundaries; no confidential roadmap or unapproved claim enters public copy.

Behind-portal acquisition/autofill is not inferred from Q50; portal autofill/submission excluded. G §2.2; W Q50 partial.

Evidence: Not examined in this run; current implementation unknown. Reference: FD053; master line 906.

Master work or verification: Keep extension undistributed and no portal automation in scope.

Expected check: Release artifact contains no enabled autofill/submit route.

Full post-award agreements/amendments/obligations/reporting/closeout remain deferred. G §2.2 supersedes broader D §11B-D/§13C.

Evidence: Not examined in this run; current implementation unknown. Reference: SU036; master line 1134.

Master work or verification: Preserve existing owner without requiring full original post-award build now.

Expected check: Tracker lists deferred source requirements separately, no accidental launch dependency.

Preserve the distinction between the earlier broad award/reporting enhancement and the current narrower MVP. AC §8; D R08 and §§11B-D versus later PG §2.2.

Evidence: Deferred; do not implement as current MVP scope. Reference: DA03; master line 201.

Master work or verification: Keep effective-agreement/amendment reconciliation, event-driven delivery-evidence collection and full reporting expansion in the deferred register. Preserve existing functionality; do not build a second obligations ledger. Continue retained submission records, outcomes, bounded financial/impact tracking and feedback drafts under their existing requirements.

Expected check: Launch checklist does not demand the deferred full workflow or falsely mark it complete. Retained actual submitted packages/outcomes and policy-aware feedback tests still run. Any future promotion names the explicit scope decision and reuses the existing operational owner.

Dependency or boundary: DR36/EX40 deferred boundary; EX14-39 retained package/outcomes/feedback; PR/BU bounded tracking. Earlier approved broad direction is **deferred from current launch** by the later scope boundary, not silently deleted and not a missing launch capability. Returning it to launch requires an explicit later scope decision.

Tentative browser or URL knowledge capture

Traceability group B02; excluded.

Scope connection: Tentative scope is retained and mapped but not counted as an approved launch capability. A final disposition is still needed; this is not a claim that the feature is canceled.

Evidence in this group: 1 unexamined in this run.

URL/browser capture for organization knowledge remains tentative, not a mandatory portal tool.

Evidence: Not examined in this run; current implementation unknown. Reference: IN31; master line 549.

Master work or verification: Keep tentative route outside mandatory scope; required opportunity link intake belongs discovery.

Expected check: Tracker distinguishes required user-added opportunity URL from tentative browser capture.

Dependency or boundary: Do not promote browser-capture proposal or excluded portal-fill extension into launch requirement.

Deferred advanced accounting and post-award scope

Traceability group B03; excluded.

Scope connection: Explicit deferred boundary, not missing MVP implementation or an additional launch feature.

Evidence in this group: 1 unexamined in this run.

Advanced accounting, elaborate dashboards and full post-award workflow stay deferred.

Evidence: Not examined in this run; current implementation unknown. Reference: PR25; master line 626.

Master work or verification: Keep bounded tracking/scenarios; reuse but do not expand retained post-award modules.

Expected check: Acceptance checklist contains entries/summaries, not accounting reconciliation or new reporting workspace.

Dependency or boundary: Original D11 broader award/reporting design is narrowed by current launch boundary.

Deferred broad post-award and automatic email workflows

Traceability group B04; excluded.

Scope connection: Explicit exclusions/deferred scope, not missing launch features. DA03 is in another topic and must join this same exclusion when consolidating.

Evidence in this group: 2 deferred.

Full post-award agreements/report drafting are excluded from current launch, despite original D §11B-D/§7A. PG §2.2

Evidence: Deferred; do not implement as current MVP scope. Reference: DR36; master line 1398.

Master work or verification: Preserve as deferred source coverage, not missing launch work

Expected check: No completion gate for deferred expansion

Automatic receipt/result email detection and full award-report workspace are not launch dependencies. PG §2.2/V14/V18

Evidence: Deferred; do not implement as current MVP scope. Reference: EX40; master line 1610.

Master work or verification: Keep manual confirmed record path; explicitly deferred expansion

Expected check: No launch implementation gate for deferred automation

Sources and traceability

- Frozen Beedy_MVP_Feature_Inventory.json, prepared 4 November 2026: all 1,128 exact IDs, verbatim master requirements, source fields, master line locations and the 80 descriptive groups. These groups comprise 55 capabilities, 17 safeguards, four integrations and four boundary groups; they are not an approved denominator for estimating completion.

- MORNING-REPORT(4).md, Space file libfile_1d98cb078b608191924cd34a042ec4f5: opening 5 November snapshot and sections 0-6 supply the latest reported state. Older log text later in the file does not override the newer opening snapshot.

- PROGRESS-LEDGER.md, Space file libfile_0a3430f26f148191aee2dc6bcfd8929f: historical endpoint and per-ID reconciliation. Its documented source disagreements and absent later deltas remain limitations.

- Beedy_MVP_Requirements_and_Gap_Comparison.md, version 3, Space file libfile_69b08711764481918ab25eb5068aa32f: authoritative requirement, bounded work and acceptance wording retained in the frozen inventory. Original master line references appear with every catalog entry.

- Original routing snapshot, Space file libfile_4ae0ca6fd8488191907e4594817296a0: fixed population against which the inventory reports complete ID-set verification.

This is a new reporting document. The frozen register, authoritative master and earlier delivered report are unchanged. Every frozen ID appears exactly once as a detailed catalog entry, including the three deferred rows. Similar-looking IDs with and without leading zeros remain distinct. No new feature, acceptance relaxation, deployment permission or policy decision is created by this document.
